## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_CY

Attempt : 2  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. PROBLEM STATEMENT:

Julia a mathematician expert is given two integers to find if the second integer is above the average of the first and second integer. Write a program that achieves this using the ternary operator.

##### ***Input Format***

The first line of input represents the first integer.

The second line of input represents the second integer.

##### ***Output Format***

The output should be displayed as "Below Average" or "Above Average"

REFER THE SAMPLE TESTCASES FOR THE FORMAT SPECIFICATIONS.

**Sample Test Case**

Input: 1

1

Output: Below Average

**Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int x=s.nextInt();
        int y=s.nextInt();
        double avg=(x+y)/2.0;
        String res=(y>avg)?"Above Average":"Below Average";
        System.out.println(res);
    }
}
```

**Status :** Correct

**Marks : 10/10**

**2. Problem Statement**

Mandy is working on a cybersecurity project that involves basic encryption techniques. She wants to write a program that takes an integer number and performs a bitwise XOR operation to flip all the bits.

Help Mandy in this encryption using bitwise operations.

**Input Format**

The input consists of an integer N, representing the number to be flipped.

**Output Format**

The output displays "Result: " followed by an integer representing the result of the bitwise XOR operation to flip all the bits.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 0

Output: Result: 255

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int a=s.nextInt();
        int res=a^255;
        System.out.println("Result:"+res);
    }
}
```

**Status :** Correct

**Marks : 10/10**

### **3. Problem Statement:**

"Write a program that helps identify the type of a triangle based on the lengths of its three sides. The program prompts the user to input the lengths of sides 'a', 'b', and 'c', and then it classifies the triangle as 'Equilateral' if all sides are equal, 'Isosceles' if two sides are equal, or 'Scalene' if all sides are different. Can you provide the Java code for this task?"

### **Input Format**

The first line of the input is an integer 'a' representing the length of side 'a.'

The second line of the input is an integer 'b' representing the length of side 'b.'

The third line of the input is an integer 'c' representing the length of side 'c.'

### Output Format

The program outputs a single line that specifies the type of the triangle:  
"Equilateral," "Isosceles," or "Scalene."

### Sample Test Case

Input: 3

4

5

Output: The triangle is Scalene

### Answer

// You are using Java

```
import java.util.Scanner;
```

```
public class Main
```

```
{
```

```
    public static void main(String[] args)
```

```
    {
```

```
        Scanner sc = new Scanner(System.in);
```

```
        int a = sc.nextInt();
```

```
        int b = sc.nextInt();
```

```
        int c = sc.nextInt();
```

```
        if (a == b && b == c)
```

```
        {
```

```
            System.out.println("The triangle is Equilateral");
```

```
        } else if (a == b || b == c || a == c)
```

```
        {
```

```
            System.out.println("The triangle is Isosceles");
```

```
        } else
```

```
        {
```

```
            System.out.println("The triangle is Scalene");
```

```
        }
```

```
    }
```

```
}
```

Status : Correct

Marks : 10/10

### 4. Problem Statement:

Gilbert is tasked with writing a program that checks whether a given integer is an odd number. An odd number is one that cannot be exactly

divided by 2. The program should take an integer as input and determine if it is an odd number or not. The task is to implement the logic to check if the provided integer is odd and return the result.

### ***Input Format***

The first line of the input contains an integer, "input".

### ***Output Format***

The output should display a boolean value, "result," which should be set to true if the input integer is an odd number and false if it is even.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 0

Output: Is the integer odd? false

### ***Answer***

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int a=s.nextInt();
        boolean res=(a%2!=0)?true:false;
        System.out.println("Is the integer odd?" +res);
    }
}
```

**Status :** Correct

### 2028\_REC\_OOPS using Java\_Week 1\_Q10

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Aishu is supervising a construction project that needs to be completed with the help of three workers: A, B, and C.

She knows how many days each of them would take to complete the entire project individually:

A can complete it in x days, B in y days, C in z days.

Initially, all three workers (A, B, and C) work together for d1 days.

After that, C leaves, and only A and B continue for another d2 days.

Then B also leaves, and A works alone to finish the remaining work.

Your task is to help aishu to implement this functionality using the class WorkDistribution and Method calculateWork(int x, int y, int z, int d1, int d2)

Calculate the total work completed in the first  $d_1$  days by A, B, and C. Calculate the work completed in the next  $d_2$  days by A and B. Determine the remaining work after these  $d_1 + d_2$  days.

***Input Format***

The first line of input contains five space-separated integers:  $x$   $y$   $z$   $d_1$   $d_2$

where:

$x$  represents the Days A takes to complete the work alone

$y$  represents the Days B takes to complete the work alone

$z$  represents the Days C takes to complete the work alone

$d_1$  represents the Days A, B, and C work together

$d_2$  represents the Days A and B work together (after C leaves)

***Output Format***

The first line of output prints "Work done in first  $d_1$  days (A+B+C): " followed by a double value rounded to 2 decimal places.

The second line of output prints "Work done in next  $d_2$  days (A+B): " followed by a double value rounded to 2 decimal places.

The third line prints "Remaining work: " followed by a double value rounded to 2 decimal places.

Refer to the sample output for formatting specifications.

***Sample Test Case***

Input: 10 20 30 2 2

Output: Work done in first  $d_1$  days (A+B+C): 0.37

Work done in next  $d_2$  days (A+B): 0.30

Remaining work: 0.33

***Answer***

```
// You are using Java
import java.util.Scanner;
```

```
public class Main
```

```
{
```

```
    public static void main(String[] args)
```

```
{
```

```
    Scanner sc = new Scanner(System.in);
```

```
    // Input values
```

```
    int x = sc.nextInt(); // Days A takes
```

```
    int y = sc.nextInt(); // Days B takes
```

```
    int z = sc.nextInt(); // Days C takes
```

```
    int d1 = sc.nextInt(); // Days A, B, C work together
```

```
    int d2 = sc.nextInt(); // Days A and B work together
```

```
    // Work done per day by A, B, and C
```

```
    double a = 1.0 / x;
```

```
    double b = 1.0 / y;
```

```
    double c = 1.0 / z;
```

```
    // Work done in first d1 days by A + B + C
```

```
    double work1 = (a + b + c) * d1;
```

```
    // Work done in next d2 days by A + B
```

```
    double work2 = (a + b) * d2;
```

```
    // Remaining work
```

```
    double remaining = 1.0 - (work1 + work2);
```

```
    // Print the results rounded to 2 decimal places
```

```
    System.out.printf("Work done in first d1 days (A+B+C): %.2f\n", work1);
```

```
    System.out.printf("Work done in next d2 days (A+B): %.2f\n", work2);
```

```
    System.out.printf("Remaining work: %.2f\n", remaining);
```

}

}

##### 1. Problem Statement

Phill is a quality control manager at a manufacturing plant. He needs to verify if a sensor reading at a midpoint station (S2) falls exactly halfway between the readings of the previous station (S1) and the next station (S3). Help him by developing a program that checks if the second sensor reading is the average (midpoint) of the first and third sensor readings.

Use the relational operator to solve the program.

##### ***Input Format***

The first line of input consists of an integer S1, representing the sensor reading of the first station.

The second line consists of an integer S2, representing the sensor reading of the midpoint station.

The third line consists of an integer S3, representing the sensor reading of the next station.

### **Output Format**

The first line of output displays a boolean value representing whether the sensor reading at the midpoint station is halfway between the readings of the first and the next stations.

The second line displays one of the following:

1. If the result is true, print "The second integer is halfway between the first and third integers."
2. Otherwise, print "The second integer is not halfway between the first and third integers."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

7

10

Output: false

The second integer is not halfway between the first and third integers.

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main
{
    public static void main(String[] args)
    {
        Scanner sc = new Scanner(System.in);
        int S1 = sc.nextInt();
        int S2 = sc.nextInt();
        int S3 = sc.nextInt();
        boolean isMidpoint = (S2 == (S1 + S3) / 2);
        System.out.println(isMidpoint);
        if (isMidpoint)
```

```
{
    System.out.println("The second integer is halfway between the first and
third integers.");
} else
{
    System.out.println("The second integer is not halfway between the first
and third integers.");
}
}
}
```

##### 1. Problem Statement

In the Kingdom of Finance, the royal treasury is managed by the treasurer, Sir Cedric. Sir Cedric tracks the daily expenses of the kingdom using an expense report that lists three major categories: food, clothing, and utilities. However, the King wants to know if the average daily expense is greater than at least two of these categories to ensure the kingdom is spending wisely.

Your task is to help Sir Cedric determine if the average daily expense is greater than two of the categories. Specifically, you need to calculate the average of the three expenses and check if it is greater than any two categories.

Note: Use the ternary operator

### ***Input Format***

Three integers a, b, and c represent the daily expenses for food, clothing, and utilities. Each integer is provided on a single line.

### ***Output Format***

The average of the three expenses, rounded to two decimal places.

A message indicating whether the average is greater than at least two of the expense categories.

1. If the average is greater than the two smallest monthly expenses, print "Average is greater than both X and Y," where X and Y are the two smallest expenses.
2. Otherwise, display "Average is not greater than two smallest expenses".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 4

6

10

Output: 6.67

Average is greater than both 4 and 6

### ***Answer***

```
import java.util.Scanner;
import java.util.Arrays;
public class Main
{
    public static void main(String[] args)
    {
        Scanner sc = new Scanner(System.in);
        int a = sc.nextInt();
        int b = sc.nextInt();
        int c = sc.nextInt();
        double average = (a + b + c) / 3.0;
        System.out.printf("%.2f\n", average);
        int[] arr = {a, b, c};
```

```
Arrays.sort(arr);
int X = arr[0];
int Y = arr[1];
String result = (average > X && average > Y)
    ? "Average is greater than both " + X + " and " + Y
    : "Average is not greater than two smallest expenses";
System.out.println(result);
    }
}
```

##### 1. Problem Statement:

Miles is working on a program that involves analyzing two integers. He wants to check if either one of the integers is both:

Less than or equal to zero, and Odd. Can you help him create a program that identifies whether either of the integers meets these conditions?

##### ***Input Format***

The input consists of two integers on separate lines, denoted as 'input1' and 'input2'.

##### ***Output Format***

A single line with a boolean result (either 'true' or 'false') indicating whether either 'input1' or 'input2' is both less than or equal to zero and odd.

Refer to the sample output for format specifications

**Sample Test Case**

Input: -45

10

Output: true

**Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s = new Scanner(System.in);
        int a=s.nextInt();
        int b=s.nextInt();
        boolean c1=(a<=0) & (a%2!=0);
        boolean c2=(b<=0) & (b%2!=0);
        System.out.println(c1 || c2);

##### 1. Problem Statement:

Emily has a beautiful circular garden in her backyard. She's interested in calculating two important measurements for her garden: the circumference and the area. To do this, she needs a program that can take the radius of her circular garden as input and provide the calculated circumference and area as output. The formulas she should use are as follows:

To calculate the circumference (C) of a circle, you can use the formula:

$$C = 2 * \pi * r$$

$$A = \pi * r^2$$

Where:

C represents the circumference.

A represents the area.

$\pi$  (pi) is approximately 3.14159.

r is the radius of the circle.

Emily is not a programmer, and she needs your help to create a program that will make these calculations for her garden.

### ***Input Format***

The first line of input contains a single double-point number radius, representing the radius of the circle.

### ***Output Format***

The output should consist of two lines:

The first line should print the circumference of the circle rounded to 2 decimal places, followed by the unit "meters".

The second line should print the area of the circle rounded to 2 decimal places, followed by the unit "square meters".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 3.0

Output: Circumference: 18.85 meters

Area: 28.27 square meters

### ***Answer***

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        final double PI=3.14159;
        Scanner scan = new Scanner(System.in);
        double rad= scan.nextDouble();
```

```
double cir=2*PI*rad;  
double area=PI*rad*rad;  
System.out.printf("Circumference: %.2f meters",cir);  
System.out.printf("\nArea: %.2f square meters",area);  
}  
}

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_Q3

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem statement

Manoj, a developer at MoneyMatters Inc., is working on improving the company's financial system. He needs to create a program that takes an integer input, converts it into a double, and displays both the original integer and the converted double value.

##### ***Input Format***

The input consists of a single integer representing a monetary amount.

##### ***Output Format***

The first line of the output displays the "Original Integer: ", followed by an integer representation of the input value.

The second line displays the "Converted Double: ", followed by a double value representing the input as a decimal value.

Refer to the sample output for the formatting specifications.

**Sample Test Case**

Input: 20

Output: Original Integer: 20

Converted Double: 20.0

**Answer**

```
// You are using Java
import java.util.Scanner;
public class Main
{
    public static void main(String[] args)
    {
        Scanner scanner = new Scanner(System.in);
        int number = scanner.nextInt();
        double converted = (double) number;
        System.out.println("Original Integer: " + number);
        System.out.println("Converted Double: " + converted);
        scanner.close();
    }
}
```

**Status :** Correct

**Marks : 10/10**

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_Q2

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. PROBLEM STATEMENT:

Dave got two students who want help with their doubt. Each hands out an integer and wants to find if one integer is positive while the other is not divisible by 3. Write a program to achieve this and conclude for them.

##### ***Input Format***

The first line of input represents the first integer.

The second line of input represents the second integer.

##### ***Output Format***

The output should display as "One of the integers is positive while the other is not divisible by 3." or "Neither of the integers meets the condition."

Refer to the sample output for the formatting specifications.

**Sample Test Case**

Input: 4

3

Output: One of the integers is positive while the other is not divisible by 3.

**Answer**

// You are using Java

```
import java.util.Scanner;
```

```
public class Main
```

```
{
```

```
    public static void main(String[] args)
```

```
    {
```

```
        Scanner scanner = new Scanner(System.in);
```

```
        int a = scanner.nextInt();
```

```
        int b = scanner.nextInt();
```

```
        boolean cond1 = (a > 0 && b % 3 != 0);
```

```
        boolean cond2 = (b > 0 && a % 3 != 0);
```

```
        if (cond1 || cond2)
```

```
        {
```

```
            System.out.println("One of the integers is positive while the other is not  
divisible by 3.");
```

```
        } else
```

```
        {
```

```
            System.out.println("Neither of the integers meets the condition.");
```

```
        }
```

```
        scanner.close();
```

```
    }
```

```
}
```

**Status : Correct**

**Marks : 10/10**

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Gloria is responsible for monitoring the performance of two machines in a factory. She needs to determine which of the two machines is operating closest to the optimal temperature of 100 degrees Celsius using the relational operator.

Assist Gloria in displaying the machine's temperature, which is closer to 100, and the difference from 100.

##### ***Input Format***

The first line of input consists of an integer N, representing the temperature of the first machine.

The second line consists of an integer M, representing the temperature of the second machine.

### **Output Format**

The output prints "The integer closer to 100 is X with a difference of Y" where X is the temperature of the closer machine and Y is the difference from 100.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 90

80

Output: The integer closer to 100 is 90 with a difference of 10

### **Answer**

```
// You are using Java
import java.util.Scanner;
class main
{
    public static void main(String[] args)
    {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int M = scanner.nextInt();
        int diffN = Math.abs(100 - N);
        int diffM = Math.abs(100 - M);
        if (diffN <= diffM)
        {
            System.out.println("The integer closer to 100 is " + N + " with a difference
of " + diffN);
        } else
        {
            System.out.println("The integer closer to 100 is " + M + " with a difference
of " + diffM);
        }
        scanner.close();
    }
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 13

#### Section 1 : MCQ

1. What is the output of the following code?

```
class TestClass {  
    public static void main(String[] args) {  
        int a = 10;  
        int b = 3;  
        System.out.println(a / b);  
    }  
}
```

**Answer**

3.3333333333333335

**Status : Wrong**

**Marks : 0/1**

2. Which of the following is not a primitive data type?

**Answer**

string

**Status : Correct**

**Marks : 1/1**

3. What is the output of the following program?

```
class Arithmetic {  
    public static void main(String[] args) {  
        char ch = 'A';  
        System.out.println(ch);  
    }  
}
```

**Answer**

A

**Status : Correct**

**Marks : 1/1**

4. What will be the output of the following code snippet?

```
class DivisionExample {  
    public static void main(String[] args) {  
        double num1 = 10.5;  
        double num2 = 3;  
        int result = (int)(num1 / num2);  
        System.out.println(result);  
    }  
}
```

**Answer**

3

**Status : Correct**

**Marks : 1/1**

5. What is the output of the following code?

```
import java.util.*;

class RelationalOperatorExample {
    public static void main(String[] args) {
        int x = 8, y = 4;
        boolean result = (x != y);

        System.out.println(result);
    }
}
```

**Answer**

true

**Status :** Correct

**Marks :** 1/1

6. What is the output of the following code?

```
class TestClass {
    public static void main(String[] args) {
        int x = 5;
        int X = 10;

        int sum = x + X;
        int bitwiseResult = x | X;

        System.out.println(sum);
        System.out.println(bitwiseResult);
    }
}
```

**Answer**

1515

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following program?

```
class DataTypesMCQ {  
    public static void main(String[] args) {  
        int a = 10;  
        double b = 5;  
        System.out.println(a / b);  
    }  
}
```

**Answer**

2.0

**Status :** Correct

**Marks :** 1/1

8. Which of the following data types is used to store floating-point numbers with greater precision?

**Answer**

float

**Status :** Wrong

**Marks :** 0/1

9. What is the output of the following program?

```
class Demo {  
    public static void main(String[] args) {  
        String text = "Hello, World!";  
        System.out.println(text);  
    }  
}
```

**Answer**

Hello, World!

**Status :** Correct

**Marks :** 1/1

10. What is the result of the following expression?

```
import java.util.*;
```

```
class ComplexExpressionExample {
    public static void main(String[] args) {
        int a = 5, b = 2, c = 3, d = 4;
        int result = a + b * c / d - b;

        System.out.println(result);
    }
}
```

**Answer**

4

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following code snippet?

```
import java.util.*;

class OperatorPrecedenceExample {
    public static void main(String[] args) {
        int a = 5, b = 3, c = 2;
        int result = a + b * c;

        System.out.println(result);
    }
}
```

**Answer**

11

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
import java.util.*;

class TernaryOperatorExample {
    public static void main(String[] args) {
```

```
int a = 5, b = 10;
int result = (a > b) ? a : b;
System.out.println(result);
}
}
```

**Answer**

10

**Status : Correct**

**Marks : 1/1**

13. Which of the following data types is used to store single characters?

**Answer**

char

**Status : Correct**

**Marks : 1/1**

14. What is the output of the following code?

```
class TestClass {
    public static void main(String[] args) {
        int count = 8;
        count = count ^ 1;

        System.out.println(count);
    }
}
```

**Answer**

9

**Status : Correct**

**Marks : 1/1**

15. What is the output of the following code?

```
class TestClass {
    public static void main(String[] args) {
```

```
int a = 5;  
int b = 10;
```

```
int sum = a + b;  
int bitwiseAnd = a & b;  
int bitwiseOr = a | b;
```

```
System.out.println(sum);  
System.out.println(bitwiseAnd);  
System.out.println(bitwiseOr);
```

```
}  
}
```

**Answer**

15015

**Status :** Correct

**Marks :** 1/1

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 2\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. What will be the output of the following code?

```
class Test {  
    public static void main(String[] args) {  
        int num = 15;  
        if (num > 10)  
            if (num % 3 == 0)  
                System.out.print("Divisible");  
            else  
                System.out.print("Not Divisible");  
        }  
    }  
}
```

**Answer**

Divisible

**Status :** Correct

**Marks :** 1/1

2. What will be the output of the following code?

```
public class Main {  
    public static void main(String[] args) {  
        int i = 10;  
        do {  
            System.out.print(i + " ");  
            i -= 3;  
        } while(i > 0);  
    }  
}
```

**Answer**

10 7 4 1

**Status :** Correct

**Marks :** 1/1

3. What will be the output of the following code?

```
class ConditionTest {  
    public static void main(String[] args) {  
        int x = 10;  
        if (x > 5)  
            System.out.print("High");  
    }  
}
```

**Answer**

High

**Status :** Correct

**Marks :** 1/1

4. What will be the output of the following code?

```
public class Main {  
    public static void main(String[] args) {
```

```
int i = 1;
while(i < 10) {
    i += 2;
}
System.out.println(i);
}
```

**Answer**

11

**Status :** Correct

**Marks :** 1/1

5. What will be the output of the following Java code snippet?

```
public class Main {
    public static void main(String[] args) {
        int day = 4;
        String result = "";
        switch(day) {
            case 1:
                result = "Monday";
                break;
            case 2:
                result = "Tuesday";
                break;
            case 3:
                result = "Wednesday";
                break;
            default:
                result = "Other Day";
        }
        System.out.println(result);
    }
}
```

**Answer**

Other Day

**Status :** Correct

**Marks :** 1/1

6. What will be the output of the following code?

```
public class Main {  
    public static void main(String[] args) {  
        int sum = 0;  
        for(int i = 1; i <= 5; i++) {  
            sum += i;  
        }  
        System.out.println(sum);  
    }  
}
```

**Answer**

15

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following code?

```
class LoopTest {  
    public static void main(String[] args) {  
        int i = 1;  
        while (i > 0) {  
            System.out.print(i + " ");  
            i++;  
            if (i == 5) break;  
        }  
    }  
}
```

**Answer**

1 2 3 4

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following code?

```
class Test {  
    public static void main(String[] args) {
```

```
int x = 5, y = 2;
if (x + y == 10)
    System.out.print("Ten");
else if (x - y == 3)
    System.out.print("Three");
else
    System.out.print("None");
}
```

**Answer**

Three

**Status :** Correct

**Marks :** 1/1

9. What will be the output of the following Java code snippet?

```
public class Main {
    public static void main(String[] args) {
        int score = 75;
        if(score >= 90) {
            System.out.println("Grade: A");
        } else if(score >= 80) {
            System.out.println("Grade: B");
        } else if(score >= 70) {
            System.out.println("Grade: C");
        } else {
            System.out.println("Grade: D");
        }
    }
}
```

**Answer**

Grade: C

**Status :** Correct

**Marks :** 1/1

10. What will be the output of the following code?

```
class ConditionTest {
    public static void main(String[] args) {
        int a = 7;
        if (a == 7)
            System.out.print("Match");
        else
            System.out.print("No Match");
    }
}
```

**Answer**

Match

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following code?

```
class Loop {
    public static void main(String[] args) {
        for (int i = 1; i <= 3; i++) {
            for (int j = 1; j <= 2; j++) {
                System.out.print(i + "" + j + " ");
            }
        }
    }
}
```

**Answer**

11 12 21 22 31 32

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
public class Main {
    public static void main(String[] args) {
        for(int i = 1; i <= 20; i = i * 2) {
            System.out.print(i + " ");
        }
    }
}
```

**Answer**

1 2 4 8 16

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
class Test {  
    public static void main(String[] args) {  
        int a = 4, b = 5;  
        if ((a + b) % 2 == 0)  
            System.out.print("Even");  
        else  
            System.out.print("Odd");  
    }  
}
```

**Answer**

Odd

**Status :** Correct

**Marks :** 1/1

14. What will be the output of the following code?

```
class LoopTest {  
    public static void main(String[] args) {  
        int i = 1;  
        do {  
            System.out.print(i + " ");  
            i *= 2;  
        } while (i <= 8);  
    }  
}
```

**Answer**

1 2 4 8

**Status :** Correct

**Marks :** 1/1

15. What will be the output of the following code?

```
class Main {  
    public static void main(String[] args) {  
        for (int i = 5; i > 0; i--) {  
            System.out.print(i + " ");  
        }  
    }  
}
```

**Answer**

5 4 3 2 1

**Status :** Correct

**Marks :** 1/1

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 2\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Arun is working on a project to automate the process of determining whether a student has passed or failed based on their subject marks.

He aims to create a simple program that takes positive integers as marks for five subjects from the user. If the average of the marks is greater than or equal to 50, the student has passed the exam. Otherwise, the student has failed.

Help Arun to implement the project.

##### ***Input Format***

The input consists of five space-separated integers, representing the marks in five subjects.

### Output Format

The first line of output prints "Average score: " followed by an integer representing the average score.

The second line prints one of the following:

1. If the condition is satisfied, print "The student has passed".
2. Otherwise, the output prints "The student has failed".

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 50 60 70 80 90

Output: Average score: 70

The student has passed

### Answer

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner sc=new Scanner(System.in);
        int m1=sc.nextInt();
        int m2=sc.nextInt();
        int m3=sc.nextInt();
        int m4=sc.nextInt();
        int m5=sc.nextInt();
        int avg=(m1+m2+m3+m4+m5)/5;
        System.out.println("Average score:"+avg);
        if(avg>=50)
            System.out.println("The student has passed");
        else
            System.out.println("The student has failed");
    }
}
```

Status : Correct

### 2028\_REC\_OOPS using Java\_Week 2\_Q2

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Samantha is a diligent math student who is exploring the world of programming. She is learning Java and has recently studied conditional statements. One day, her teacher gives her an interesting problem to solve, which takes a number as input and checks whether it is a multiple of 5 or 7.

Help her complete the task.

##### ***Input Format***

The input consists of a single integer N, representing the number to be checked.

##### ***Output Format***

If the number is a multiple of 5 but not 7, the output prints "N is a multiple of 5"

If the number is a multiple of 7, the output prints "N is a multiple of 7".

Otherwise the output prints "N is neither multiple of 5 nor 7" where N is an entered integer.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 10

Output: 10 is a multiple of 5

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int N=s.nextInt();
        if(N%5==0 && N%7!=0)
            System.out.println(N+" is a multiple of 5");
        else if(N%7==0)
            System.out.println(N+" is a multiple of 7");
        else
            System.out.println(N+" is neither multiple of 5 nor 7");
    }
}
```

**Status :** Correct

Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

John is a fitness trainer, and he wants to use the BMI calculator to assess the body mass index of his clients. He has a list of clients based on their height and weight.

John plans to write a program to quickly determine the BMI and provide a classification for each client.

If BMI is less than 18.5, the program will classify it as "Underweight" If BMI is between 18.6 and 24.9, the program will classify it as "Normal Weight" If BMI is between 25.0 and 29.9, the program will classify it as "Overweight" If BMI is 30.0 or higher, the program will classify it as "Obese"

Note: Formula to calculate BMI =  $\text{weight}/(\text{height}*\text{height})$

**Input Format**

The first line of input consists of a double value, representing the height of the person in meters.

The second line consists of a double value, representing the weight of the person in kilograms.

### **Output Format**

The first line of output prints "BMI: " followed by a double (rounded to two decimal places) representing the calculated BMI.

The second line prints "Classification: " followed by a string indicating the BMI category (Underweight, Normal Weight, Overweight, or Obese).

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1.2

45.2

Output: BMI: 31.39

Classification: Obese

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        double h=s.nextDouble();
        double w=s.nextDouble();
        double roundedBMI=w/(h*h);
        System.out.printf("BMI: %.2f\n",roundedBMI);
        if(roundedBMI <18.5)
            System.out.print("Classification: Underweight");
        else if(roundedBMI>=18.6 && roundedBMI <24.9)
            System.out.print("Classification: Normal Weight");
        else if(roundedBMI >=25.0 && roundedBMI <29.9)
            System.out.print("Classification: Overweight");
        else
            System.out.print("Classification: Obese");
```

}  
}

#### Section 1 : Coding

##### 1. Problem Statement

Amit wants to evaluate the depreciation of his car over time to understand its current value and categorize it based on that value.

Write a program that helps him determine the current value of his car after a certain number of years of depreciation and classify it into one of three categories:

High: If the current value is greater than 10,000. Medium: If the current value is between 5,000 and 10,000, both inclusive. Low: If the current value is less than 5,000.

The depreciation rate of the car is 15% per year. The program should calculate the current value of the car after applying this depreciation over the given number of years and print the current value along with the category.

### ***Input Format***

The first line of input consists of an integer, representing the initial cost of the car.

The second line consists of an integer, representing the number of years the car has been depreciating.

### ***Output Format***

The first line of output prints a double value, representing the current value of the car, rounded off to two decimal places "Current Value: <value>".

The second line prints its category "Category: <categories>".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 20000  
5

Output: Current Value: 8874.11  
Category: Medium

### ***Answer***

```
import java.util.Scanner;
import java.text.DecimalFormat;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int initialCost = s.nextInt();
        int years = s.nextInt();
        double currentValue = initialCost;
        for (int i = 0; i < years; i++) {
            currentValue *= 0.85;
        }
        DecimalFormat df = new DecimalFormat("#.00");
        String formattedValue = df.format(currentValue);
        System.out.println("Current Value: " + formattedValue);
        if (currentValue > 10000) {
            System.out.println("Category: High");
        }
    }
}
```

```
} else if (currentValue >= 5000)
{
    System.out.println("Category: Medium");
} else
{
    System.out.println("Category: Low");
}
}
```

##### 1. Problem Statement

Ted, the computer science enthusiast, has accepted the challenge of writing a program that checks if the number of digits in an integer matches the sum of its digits.

Guide Ted in designing and writing the code to solve this problem using a 'do-while' loop.

##### ***Input Format***

The input consists of an integer N, representing the number to be checked.

##### ***Output Format***

If the sum is equal to the number of digits, print "The number of digits in N matches the sum of its digits."

Else, print "The number of digits in N does not match the sum of its digits."

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: 20

Output: The number of digits in 20 matches the sum of its digits.

**Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s = new Scanner(System.in);
        int n=s.nextInt();
        int temp=n;
        int sum=0;
        int c=0;
        do{
            int d=temp%10;
            sum+=d;
            c++;
            temp/=10;
        }while(temp>0);
        if(sum==c)
            System.out.printf("The number of digits in %d matches the sum of its
digits.",n);
        else
            System.out.printf("The number of digits in %d does not match the sum of
its digits.",n);
        }
    }
```

##### 1. Problem Statement

Maya, a student in an arts and crafts class, wants to create a pattern using stars (\*) in a specific format. She plans to use a program to help her construct the pattern.

Write a program that takes an integer as input and constructs the following pattern using nested for loops.

Input: 5

Output:

\*  
\* \*

```
* * * *
* * * *
* * * * *
* * * *
* * *
* *
*
*
```

### ***Input Format***

The input consists of a number (integer) representing the number of rows.

### ***Output Format***

The output displays the required pattern.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 5

Output: \*

```
* *
* * *
* * * *
* * * * *
* * * *
* * *
* *
*
*
```

### ***Answer***

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
```

```
int n=s.nextInt();
for(int i=1;i <=n;i++){
    for(int j=1;j <=n;j++){
        System.out.println("* ");
    }
    System.out.println();
}
for(int i=n-1;i >=1;i--){
    for(int j=n-1;j >=1;j--){
        System.out.println("* ");
    }
    System.out.println();
}
}

##### 1. Problem Statement

You are taking part in a coding challenge where your task is to design a program that conjures a mesmerizing numerical pyramid pattern. The enchanting pattern is fashioned using a for loop and is customized based on user input.

Participants are prompted to unveil the pyramid's magic by specifying its height - essentially dictating the number of rows in this spellbinding creation.

Write a program that employs to weave this captivating numerical pyramid as shown below.

Example

Input:

4

Output:

### ***Input Format***

The input consists of a positive integer n representing the number of rows in the pattern.

### ***Output Format***

The output prints the required pyramid pattern, as shown in the sample output.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

Output: 1

123

12345

1234567

##### 1. Problem Statement

Rohit is tasked with designing a program to analyze the digits of a given integer.

Write a program to help Rohit that takes an integer as input and identifies the minimum odd digit and the maximum even digit present in the number. If no odd or even digits are present, display appropriate messages.

Implement the solution using a 'while' loop to iterate through the digits of the given number.

##### ***Input Format***

The input consists of an integer n.

##### ***Output Format***

The first line of output prints the message "Minimum odd digit: " followed by an integer representing the smallest odd digit found in the input number.

If no odd digit exists, it prints "There are no odd digits in the number."

The second line of output prints the message "Maximum even digit: " followed by an integer representing the largest even digit found in the input number.

If no even digit exists, it prints "There are no even digits in the number."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 3465

Output: Minimum odd digit: 3

Maximum even digit: 6

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int n = s.nextInt();
        int maxeven = -1;
        int minodd = 10;
        int d;
        int temp = n;
        while (temp > 0) {
            d = temp % 10;
            if (d % 2 == 0) {
                if (d > maxeven) {
                    maxeven = d;
                }
            }
            else{
                if (d < minodd) {
                    minodd = d;
                }
            }
            temp = temp / 10;
        }
        if (maxeven == -1) {
            System.out.println("There are no even digits in the number.");
        }
        else {

## 2. Problem Statement

You are given a number of distribution centers (rows) and are tasked with generating a zigzag shipment route pattern. Each shipment route should alternate between left-to-right and right-to-left, as described below.

The program should print the zigzag pattern with a tab (\t) separating the columns. For each row, the shipment numbers should follow a diagonal pattern where numbers are placed in a zigzag, left to right on odd rows and right to left on even rows.

### **Input Format**

The input consists of an integer N, which represents the number of distribution centers (rows) for the zigzag pattern.

### **Output Format**

The output prints the zigzag pattern with N rows, formatted with a tab space (\t) separating the columns.

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 5

Output:       1  
          2  6  
         3  7  10  
        4  8  11  13  
       5  9  12  14  15

### Answer

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int r = sc.nextInt();
        int[][] pyramid = new int[r][r];
        int num = 1;
        for (int col = 0; col < r; col++) {
            for (int row = col; row < r; row++) {
                pyramid[row][col] = num;
                num++;
            }
        }
        int maxNum = r * (r + 1) / 2;
        int width = String.valueOf(maxNum).length() + 1;
        for (int i = 0; i < r; i++) {
            for (int s = 0; s < (r - i - 1) * width; s++) {
                System.out.print(" ");
            }
            for (int j = 0; j <= i; j++) {
                System.out.print(pyramid[i][j]);
                int numLength = String.valueOf(pyramid[i][j]).length();
                for (int sp = 0; sp < (width - numLength); sp++) {
                    System.out.print(" ");
                }
            }
            System.out.println();
        }
    }
}
```

Status : Correct

Marks : 10/10

### 3. Problem Statement

Ravi wants to estimate the total utility bill for a household based on the consumption of electricity, water, and gas.

Write a program to calculate the total bill using the following criteria:

The cost per unit for electricity is 0.12, for water is 0.05, and for gas is 0.08. A discount is applied to the total cost based on the following conditions: If the total cost is 100 or more, a 10% discount is applied. If the total cost is between 50 and 99.99, a 5% discount is applied. No discount is applied if the total cost is less than 50.

The program should output the total bill after applying the discount with two decimal places.

#### ***Input Format***

The input consists of three double values, representing the number of units consumed for electricity, water, and gas respectively.

#### ***Output Format***

The output prints a double value, representing the total bill after applying the discount, formatted to two decimal places.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 1000.0

200.0

100.0

Output: 124.20

#### ***Answer***

```
// You are using Java
import java.util.Scanner;
```

```

public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        double e=s.nextDouble();
        double w=s.nextDouble();
        double g=s.nextDouble();
        final double e_rate= 0.12;
        final double w_rate= 0.05;
        final double g_rate= 0.08;
        double total=(e*e_rate)+(w*w_rate)+(g*g_rate);
        if(total>=100)
            total*=0.90;
        else if(total>=50)
            total*=0.95;
        System.out.printf("%.2f",total);
    }
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Sampad is a high school teacher who wants to convert numeric grades into letter grades.

Write a program that accepts a numeric grade as input. The program should then convert this numeric grade into a letter grade based on specific conditions. The letter grades are A, B, C, D and F.

The conversion is determined by the following conditions:

If the numeric grade is 90 or higher, it's an "A"  
 If the numeric grade is between 80 and 89 (inclusive), it's a "B"  
 If the numeric grade is between 70 and 79 (inclusive), it's a "C"  
 If the numeric grade is between 60 and 69 (inclusive), it's a "D"  
 If the numeric grade is below 60, it's an "F"

##### **Input Format**

The input consists of an integer representing the numeric grade of the student.

##### **Output Format**

The output prints the letter grade corresponding to the input numeric grade as "Letter Grade: <grade>".

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 85

Output: Letter Grade: B

### **Answer**

```
// You are using Java
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int m=s.nextInt();
        char a;
        if(m >=90)
            a='A';
        else if(m>=80 && m<=89)
            a='B';
        else if(m>=70 && m<=79)
            a='C';
        else if(m>=60 && m<=69)
            a='D';
        else
            a='F';
        System.out.println("Letter Grade: "+a);
    }
}
```

**Status :** Correct

**Marks :** 10/10

#### Section 1 : Coding

##### 1. Problem Statement

Raj is solving a physics problem involving projectile motion, where he needs to calculate the time a ball hits the ground using a quadratic equation of the form  $ax^2 + bx + c = 0$ . Depending on the coefficients, the ball may hit the ground once, twice, or not at all in real time.

Help Raj find all real roots of the equation, if any.

Note: discriminant =  $b^2 - 4ac$

##### ***Input Format***

The input consists of three space-separated doubles a, b, and c, representing the coefficients of the quadratic equation.

##### ***Output Format***

If there are two real roots, print:

- "Two real solutions:"
- "Root1 = <value>"
- "Root2 = <value>"

If there is one real root, print:

- "One real solution:"
- "Root = <value>"

If there are no real roots, print:

- "There are no real solutions."

Note: values are rounded to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1 6 9

Output: One real solution:

Root = -3.00

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner scanner = new Scanner(System.in);
        double a = scanner.nextDouble();
        double b = scanner.nextDouble();
        double c = scanner.nextDouble();
        double discriminant = b * b - 4 * a * c;
        if (discriminant > 0) {
            double root1 = (-b + Math.sqrt(discriminant)) / (2 * a);
            double root2 = (-b - Math.sqrt(discriminant)) / (2 * a);
            System.out.println("Two real solutions:");
            System.out.printf("Root1 = %.2f\n", root1);
            System.out.printf("Root2 = %.2f\n", root2);
        }
    }
}
```

```

    } else if (discriminant == 0)
    {
        double root = -b / (2 * a);
        System.out.println("One real solution:");
        System.out.printf("Root = %.2f\n", root);
    } else
    {
        System.out.println("There are no real solutions.");
    }
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Maya, a student in an arts and crafts class, wants to create a pattern using stars (\*) in a specific format. She plans to use a program to help her construct the pattern.

Write a program that takes an integer as input and constructs the following pattern using nested for loops.

Input: 5

Output:

```

*
* *
* * *
* * * *
* * * * *
* * * *
* * *
* *
*

```

### ***Input Format***

The input consists of a number (integer) representing the number of rows.

### ***Output Format***

The output displays the required pattern.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 5

Output: \*

```
* *
* * *
* * * *
* * * * *
* * * *
* * * *
* * *
* *
*
```

### ***Answer***

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int rows = scanner.nextInt();
        for (int i = 1; i <= rows; i++) {
            for (int j = 1; j <= i; j++) {
                System.out.print("* ");
            }
            System.out.println();
        }
        for (int i = rows - 1; i >= 1; i--){
            for (int j = 1; j <= i; j++){
                System.out.print("* ");
            }
            System.out.println();
        }
    }
}
```

**Status : Correct**

**Marks : 10/10**

### 3. Problem Statement

Joe has a favourite number, let's call it X. He wants to check if X is divisible by the sum of its digits. If it is, he considers it a lucky number. If not, he wants to find the closest smaller number, that is divisible by the sum of digits of X. Joe has challenged his friends to solve this puzzle at his birthday party.

#### Example

Input:

157

Output:

157 is not divisible by the sum of its digits.

The closest smaller number that is divisible: 156

Explanation:

The sum of the digits of X is  $1+5+7=13$ . Since 157 is not divisible by 13, we need to find the closest smaller number that is divisible by 13. 156 is divisible by 13, it is the closest smaller number that meets the requirement.

#### ***Input Format***

The input consists of an integer X, representing Joe's favourite number.

#### ***Output Format***

If X is a lucky number, then the output must be in the format: "X is divisible by the sum of its digits."

If not, then the output must be in the format:

"X is not divisible by the sum of its digits."

The closest smaller number that is divisible: Y",  
where X is the entered number and Y is the closest number.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 120

Output: 120 is divisible by the sum of its digits.

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int x = scanner.nextInt();
        int sum = 0;
        int temp = x;
        while (temp > 0) {
            sum = sum + temp % 10;
            temp = temp / 10;
        }
        if (x % sum == 0) {
            System.out.println(x + " is divisible by the sum of its digits.");
        } else {
            System.out.println(x + " is not divisible by the sum of its digits.");
            int y = x - 1;
            while (y % sum != 0) {
                y--;
            }
            System.out.println("The closest smaller number that is divisible: " + y);
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

## **4. Problem Statement**

Ram wants to evaluate the time required to break even on an investment based on initial costs, monthly profits, and monthly expenses. Write a program to calculate the break-even point in months and categorize the return on investment.

Compute the break-even point by using the formula:  $\text{initial cost} / (\text{monthly profit} - \text{monthly expenses})$ . Based on the break-even point, classify the return on investment into one of the following categories: Quick Return: If the break-even point is 3 months or fewer. Average Return: If the break-even point is between 4 and 12 months, inclusive. Long-term Return: If the break-even point exceeds 12 months.

Ram is new to programming, so he seeks your assistance in creating the program.

Note: monthly profit is always greater than monthly expenses.

#### ***Input Format***

The first line of input consists of a double value representing the initial cost.

The second line consists of a double value representing the monthly profit.

The third line consists of a double value representing the monthly expenses.

#### ***Output Format***

The first line prints "Break-even Point:", followed by the break-even point as a decimal number (of double datatype), formatted to two decimal places.

The second line prints "Category: ", followed by the investment return as a String, which can be one of:

- "Quick Return" if break-even point  $\leq 3$
- "Average Return" if break-even point  $\leq 12$
- "Long-term Return" if break-even point  $> 12$

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 10000.50

5000.75

1000.10

Output: Break-even Point: 2.50

Category: Quick Return

**Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        double initialCost = scanner.nextDouble();
        double monthlyProfit = scanner.nextDouble();
        double monthlyExpenses = scanner.nextDouble();
        double breakEvenPoint = initialCost / (monthlyProfit - monthlyExpenses);
        System.out.printf("Break-even Point: %.2f\n", breakEvenPoint);
        if (breakEvenPoint <= 3) {
            System.out.println("Category: Quick Return");
        } else if (breakEvenPoint <= 12) {
            System.out.println("Category: Average Return");
        } else {
            System.out.println("Category: Long-term Return");
        }
    }
}
```

### REC\_2028\_OOPS using Java\_Week 3\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[] a = {1, 2, 3, 4};  
        for (int i = 0; i < a.length; i++) {  
            if (a[i] % 2 == 0)  
                a[i] = 0;  
        }  
        System.out.println(a[1] + " " + a[3]);  
    }  
}
```

**Answer**

0 0

Status : Correct

Marks : 1/1

2. What will be the output of the following code?

```
class Sample {  
    public static void main(String[] args) {  
        int[] a = {1, 2, 3};  
        int product = 1;  
        for (int i = 0; i < a.length; i++) {  
            product *= a[i];  
        }  
        System.out.println(product);  
    }  
}
```

Answer

6

Status : Correct

Marks : 1/1

3. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[][] a = {  
            {1, 2},  
            {3, 4}  
        };  
        int sum = 0;  
        for (int i = 0; i < a.length; i++)  
            for (int j = 0; j < a[0].length; j++)  
                sum += a[i][j];  
        System.out.println(sum);  
    }  
}
```

Answer

10

Status : Correct

Marks : 1/1

4. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[][] a = {  
            {1, 2},  
            {3, 4}  
        };  
        for (int i = 0; i < a.length; i++) {  
            for (int j = 0; j < a[0].length; j++) {  
                System.out.print(a[i][j] + " ");  
            }  
        }  
    }  
}
```

Answer

1 2 3 4

Status : Correct

Marks : 1/1

5. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[] nums = {3, 6, 7, 2, 8};  
        int sum = 0;  
        for (int i = 0; i < nums.length; i++) {  
            if (nums[i] % 2 == 0)  
                sum += nums[i];  
        }  
        System.out.println(sum);  
    }  
}
```

Answer

16

Status : Correct

Marks : 1/1

6. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[][] arr = {  
            {5, 6, 7},  
            {8, 9, 10}  
        };  
        System.out.println(arr[0][2]);  
    }  
}
```

Answer

7

Status : Correct

Marks : 1/1

7. What will be the output of the following code?

```
public class Test {  
    public static void main(String[] args) {  
        int[] x = {4, 8, 12};  
        int result = x[0] * x[2];  
        System.out.println(result);  
    }  
}
```

Answer

48

Status : Correct

Marks : 1/1

8. What will be the output of the following code?

```
class Sample {
```

```

public static void main(String[] args) {
    int[][] data = {
        {1, 2},
        {3, 4}
    };
    int sum = 0;

    for (int[] row : data) {
        for (int val : row) {
            sum += val;
        }
    }

    System.out.println("Sum = " + sum);
}

```

**Answer**

Sum = 10

**Status :** Correct

**Marks :** 1/1

9. What will be the output of the given code?

```

public class Main {
    public static void main(String[] args) {
        int[] arr = {1, 2, 3, 4, 5};
        int n = arr.length;
        int temp = arr[0];

        for (int i = 0; i < n - 1; i++) {
            arr[i] = arr[i + 1];
        }
        arr[n - 1] = temp;

        for (int num : arr) {
            System.out.print(num + " ");
        }
    }
}

```

```
}
```

**Answer**

2 3 4 5 1

**Status :** Correct

**Marks :** 1/1

10. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[] nums = {4, 2, 9, 5};  
        int max = nums[0];  
        for (int i = 1; i < nums.length; i++) {  
            if (nums[i] > max)  
                max = nums[i];  
        }  
        System.out.println(max);  
    }  
}
```

**Answer**

9

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following code?

```
class ReverseArray {  
    public static void main(String[] args) {  
        int[] a = {1, 2, 3, 4};  
        for (int i = 0; i < a.length / 2; i++) {  
            int temp = a[i];  
            a[i] = a[a.length - 1 - i];  
            a[a.length - 1 - i] = temp;  
        }  
        for (int i : a)  
            System.out.print(i + " ");  
    }  
}
```

```
}
```

**Answer**

4 3 2 1

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
class Sample {  
    public static void main(String[] args) {  
        int[][] matrix = {  
            {1, 2, 3},  
            {4, 5, 6}  
        };  
        System.out.println(matrix[1][2]);  
    }  
}
```

**Answer**

6

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
class M {  
    public static void main(String[] args) {  
        int[][] arr = {  
            {1, 2},  
            {3, 4},  
            {5, 6}  
        };  
  
        for (int i = 0; i < arr.length; i++) {  
            System.out.print(arr[i][0] + " ");  
        }  
    }  
}
```

**Answer**

1 3 5

**Status :** Correct

**Marks :** 1/1

14. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[] a = {1, 2, 1, 3, 1, 4};  
        int count = 0;  
        for (int i = 0; i < a.length; i++) {  
            if (a[i] == 1) count++;  
        }  
        System.out.println(count);  
    }  
}
```

**Answer**

3

**Status :** Correct

**Marks :** 1/1

15. What will be the output of the following code?

```
class Q {  
    public static void main(String[] args) {  
        int[] a = {1, 2, 3, 4};  
        for (int i = 0; i < a.length / 2; i++) {  
            int temp = a[i];  
            a[i] = a[a.length - 1 - i];  
            a[a.length - 1 - i] = temp;  
        }  
        System.out.println(a[0]);  
    }  
}
```

#### Section 1 : Coding

##### 1. Problem Statement

Rosh is intrigued by numerical patterns. Today, she stumbled upon a puzzle while working with arrays. She wants to compute the sum of the third-largest and second-smallest elements from a list of integers. She seeks your help to implement a program that solves this for her efficiently.

##### ***Input Format***

The first line of input is an integer N, representing the size of the array.

The second line of input consists of N space-separated integers, representing the elements of the array.

##### ***Output Format***

The output displays a single integer representing the sum of the third-largest and second-smallest elements in the array.

Refer to the sample output for the formatting specifications.

**Sample Test Case**

Input: 10

10 20 30 40 50 60 70 80 90 100

Output: 100

**Answer**

```
import java.util.*;

public class Main
{

    public static void main(String[] args)
    {

        Scanner sc = new Scanner(System.in);

        // Step 1: Read the size of the array
        int N = sc.nextInt();

        // Step 2: Create an array to store numbers
        int[] arr = new int[N];

        // Step 3: Read array elements
        for (int i = 0; i < N; i++)
        {

            arr[i] = sc.nextInt();

        }

    }

}
```

```
// Step 4: Sort the array (smallest largest)
Arrays.sort(arr);

// Step 5: Pick required elements
int secondSmallest = arr[1]; // index 1 = 2nd smallest
int thirdLargest = arr[N - 3]; // index N-3 = 3rd largest

// Step 6: Compute sum
int result = secondSmallest + thirdLargest;

// Step 7: Print result
System.out.println(result);
sc.close();
}
}
```

Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Monica is interested in finding a treasure but the key to opening is to get the sum of the main diagonal elements and secondary diagonal elements.

Write a program to help Monica find the diagonal sum of a square 2D array.

Note: The main diagonal of the array consists of the elements traversing from the top-left corner to the bottom-right corner. The secondary diagonal includes elements from the top-right corner to the bottom-left corner.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of rows and columns.

The following N lines consist of N space-separated integers, representing the 2D array elements.

### **Output Format**

The first line of output prints "Sum of the main diagonal: " followed by an integer, representing the sum of the main diagonal.

The second line prints "Sum of the secondary diagonal: " followed by an integer, representing the sum of the secondary diagonal.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 3

1 2 3

4 5 6

7 8 9

Output: Sum of the main diagonal: 15

Sum of the secondary diagonal: 15

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s = new Scanner(System.in);
        int n=s.nextInt();
        int[][] arr=new int[n][n];
        for(int i=0;i<n;i++){
            for(int j=0;j<n;j++){
                arr[i][j]=s.nextInt();
            }
        }
        int main_diagonal=0;
        int second_diagonal=0;
        for(int i=0;i<n;i++){
            main_diagonal+=arr[i][i];
            second_diagonal+=arr[i][n-1-i];
        }
        System.out.println("Sum of the main diagonal:"+main_diagonal);
```

```
System.out.println("Sum of the secondary diagonal: "+second_diagonal);
```

#### Section 1 : Coding

##### 1. Problem Statement

You are developing a warehouse management system for a shipping company. The system uses an integer array to represent the weights of packages in a specific order. To verify that the weight capacity is not exceeded, the program needs to calculate the sum of the weights of the first and last packages in the list.

Task:

Write a code to calculate the sum of the weights of the first and last packages in the list. The program should take an integer array as input and return the total weight of the first and last packages.

##### ***Input Format***

The first line of the input is an integer N representing the size of the array.

The second line of the input is N space-separated integer values.

### **Output Format**

The output is displayed in the following format:

"Sum of the first and last elements: <<Sum>>"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

10 20 30 40 50

Output: Sum of the first and last elements: 60

### **Answer**

```
import java.util.*;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int n=s.nextInt();
        int[] a=new int[n];
        for(int i=0;i<n;i++){
            a[i]=s.nextInt();
        }
        int first=a[0];
        int last=a[n-1];
        int sum=first+last;
        System.out.println("Sum of the first and last elements: "+sum);
    }
}
```

##### 1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

##### ***Input Format***

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

### **Output Format**

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 3 3

1 2 3

4 5 6

7 8 9

1 1 1

2 2 2

3 3 3

Output: 2 3 4

6 7 8

10 11 12

### **Answer**

```
import java.util.*;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int n=s.nextInt();
        int m=s.nextInt();
        int [][] a=new int[n][m];
        int [][] b=new int[n][m];
        int [][] res=new int[n][m];
        for(int i=0;i<n;i++){
            for(int j=0;j<m;j++){
                a[i][j]=s.nextInt();
            }
        }
        for(int i=0;i<n;i++){
            for(int j=0;j<m;j++){
                b[i][j]=s.nextInt();
```

```
    }  
  }  
  for(int i=0;i<n;i++){  
    for(int j=0;j<m;j++){  
      res[i][j]=a[i][j]+b[i][j];  
    }  
  }  
  for(int i=0;i<n;i++){  
    for(int j=0;j<m;j++){  
      System.out.print(res[i][j]+" ");  
    }  
  }  
  System.out.println();  
}
```

##### 1. Problem Statement

Priya is building a system to automate image transformations using matrix operations. To do this, she needs to multiply two matrices representing pixel data and transformation rules.

Help Priya perform matrix multiplication and print the resulting matrix if the operation is valid.

##### ***Input Format***

The first line of input consists of two int values, representing the number of rows R1 and columns C1 of the first matrix.

The next R1 × C1 integers represent the elements of the first matrix.

The next line consists of two int values, representing the number of rows R2 and

columns C2 of the second matrix.

The next  $R2 \times C2$  integers represent the elements of the second matrix.

### **Output Format**

If matrix multiplication is possible, print R1 lines, each containing C2 space-separated int values representing the resulting matrix.

Otherwise, print "Matrix multiplication not possible".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 2 3

1 2 3

4 5 6

3 2

7 8

9 10

11 12

Output: 58 64

139 154

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int R1 = sc.nextInt();
        int C1 = sc.nextInt();
        int[][] matrix1 = new int[R1][C1];
        for (int i = 0; i < R1; i++) {
            for (int j = 0; j < C1; j++) {
                matrix1[i][j] = sc.nextInt();
            }
        }
        int R2 = sc.nextInt();
        int C2 = sc.nextInt();
        int[][] matrix2 = new int[R2][C2];
```

```

    for (int i = 0; i < R2; i++) {
        for (int j = 0; j < C2; j++) {
            matrix2[i][j] = sc.nextInt();
        }
    }
    if (C1 != R2) {
        System.out.println("Matrix multiplication not possible");
        return;
    }
    int[][] result = new int[R1][C2];
    for (int i = 0; i < R1; i++) {
        for (int j = 0; j < C2; j++) {
            int sum = 0;
            for (int k = 0; k < C1; k++){
                sum += matrix1[i][k] * matrix2[k][j];
            }
            result[i][j] = sum;
        }
    }
    for (int i = 0; i < R1; i++) {

## 2. Problem Statement

Eminem is a billiard player who enjoys playing billiards and also likes solving mathematical puzzles. He notices that the billiard balls on the table are arranged in a grid, and he is curious to find the sum of the numbers written on each ball.

Write a program to find the sum of all the numbers written on each ball in the grid.

### ***Input Format***

The first line of input consists of an integer N, representing the number of rows.

The second line consists of an integer M, representing the number of columns.

The following lines N lines consist of M space-separated integers, representing the numbers written on each ball.

### ***Output Format***

The output prints an integer representing the sum of all the numbers written on each ball.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 3

3

1 2 3

4 5 6

7 8 9

Output: 45

### ***Answer***

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int n=s.nextInt();
        int m=s.nextInt();
        int[][]arr=new int[n][m];
        int sum=0;
        for(int i=0;i<n;i++){
            for(int j=0;j<m;j++){
                arr[i][j]=s.nextInt();
            }
        }
        for(int i=0;i<n;i++){
            for(int j=0;j<m;j++){
```

```
        sum+=arr[i][j];
    }
}
System.out.println(sum);
}
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Egath is participating in a coding hackathon, and one of the challenges requires him to work with an array of integers. The task is to remove exactly one element from the array such that the sum of the remaining elements is a prime number.

Help Egath find the first possible prime sum by removing one element or determining if no such prime sum can be achieved.

#### **Input Format**

The first line of input consists of an integer N, representing the number of elements in the array.

The second line consists of N space-separated integers, representing the array elements.

#### **Output Format**

If removing one element results in a prime sum, print the sum.

If no such prime sum can be achieved by removing exactly one element, print "No valid prime sum found".

Refer to the sample output for formatting specifications.

#### **Sample Test Case**

Input: 3  
1 2 3

Output: 5

**Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int n = scanner.nextInt();
        int[] arr = new int[n];
        int totalSum = 0;
        for (int i = 0; i < n; i++) {
            arr[i] = scanner.nextInt();
            totalSum += arr[i];
        }
        boolean found = false;
        for (int i = 0; i < n; i++) {
            int newSum = totalSum - arr[i];
            if (newSum > 1) {
                boolean isPrime = true;
                for (int j = 2; j * j <= newSum; j++){
                    if (newSum % j == 0) {
                        isPrime = false;
                        break;
                    }
                }
                if (isPrime) {
                    System.out.println(newSum);
                    found = true;
                    break;
                }
            }
        }
        if (!found) {
            System.out.println("No valid prime sum found");
        }
    }
}
```

**Status :** Correct

**Marks : 10/10**

4. Problem Statement

In a customer loyalty program, reward points are logged in a sorted array as customers make transactions. Occasionally, due to system errors, duplicate entries for the same transaction may appear. To ensure accurate reward calculations, it's crucial to remove these duplicates from the list.

Write a program to process the array of reward points, removing any duplicates while preserving the order of unique entries. The program should then display the cleaned list of unique reward points and the total count of these unique points.

### ***Input Format***

The first line of input consists of an integer N, representing the number of reward points.

The second line consists of N space-separated integers, representing the reward points in sorted order.

### ***Output Format***

The first line of output prints the cleaned list of unique reward points separated by a space.

The second line of output prints an integer representing the total count of unique reward points.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 3  
100 100 200  
Output: 100 200  
2

### ***Answer***

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s= new Scanner(System.in);
```

```
int n=s.nextInt();
int[] arr= new int[n];
for(int i=0;i<n;i++){
    arr[i]=s.nextInt();
}
System.out.print(arr[0]+" ");
int count=1;
for(int i=1;i<n;i++){
    if(arr[i]!=arr[i-1]){
        System.out.print(arr[i]+" ");
        count++;
    }
}
System.out.println();
System.out.print(count);
}
```

##### 1. Problem Statement

Emma is a data analyst working with a grid-based system where each cell contains important numerical data. The grid represents spatial data, inventory records, or structured reports that require periodic updates.

Due to system updates and new requirements, Emma needs to modify the grid in the following ways:

She wants to insert either a new row or a new column at a given position. Later, she needs to delete either a row or a column from the modified matrix.

##### ***Input Format***

The first line contains two integers rows and cols (the dimensions of the matrix).

The next rows lines contain cols space-separated integers representing the initial matrix.

The next line contains two integers insertType and insertIndex:

- insertType = 0 for row insertion, 1 for column insertion.
- insertIndex is the position where the new row/column should be added.

If inserting a row, the next cols integers represent the new row or If inserting a column, the next rows integers represent the new column.

The next line contains two integers deleteType and deleteIndex:

- deleteType = 0 for row deletion, 1 for column deletion.
- deleteIndex is the position to be deleted.

### **Output Format**

The first line of output prints the string "After insertion" followed by the modified matrix with the inserted row or column.

Each row of the matrix is printed on a new line with space-separated integers.

The next line prints the string "After deletion" followed by the final matrix after the specified deletion operation.

Each row of the resulting matrix is printed on a new line with space-separated integers.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

        for (int c = 0; c < cols; c++) {
            newMatrix[r][c] = matrix[i][c];
        }
        r++;
    }
}

```

```

        matrix = newMatrix;
        rows--;
    } else
    {
        int[][] newMatrix = new int[rows][cols - 1];
        for (int r = 0; r < rows; r++) {
            for (int c = 0, nc = 0; c < cols; c++) {
                if (c == deleteIndex) continue;
                newMatrix[r][nc] = matrix[r][c];
                nc++;
            }
        }
        matrix = newMatrix;
        cols--;
    }
    System.out.println("After deletion");
    for (int i = 0; i < rows; i++) {
        for (int j = 0; j < cols; j++) {
            System.out.print(matrix[i][j] + " ");
        }
        System.out.println();
    }
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement:

Mason is participating in a coding challenge where he must manipulate an integer array. His task is to replace every element in the array with the next greatest element to its right. The last element of the array remains unchanged, as there is no element to its right.

Your job is to help Mason write a program that performs this transformation and outputs the modified array.

### **Input Format**

The first line of input contains an integer  $n$  representing the number of elements in the array.

The second line of input contains n space-separated integers representing the elements of the array.

### **Output Format**

The output prints the modified array of n integers, where each element (except the last one) is replaced by the maximum element to its right, and the last element remains unchanged.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 6

12 3 91 15 12 14

Output: 91 91 15 14 14 14

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int n = s.nextInt();
        int[] arr = new int[n];
        for (int i = 0; i < n; i++) {
            arr[i] = s.nextInt();
        }
        for (int i = 0; i < n - 1; i++) {
            int max = arr[i + 1];
            for (int j = i + 1; j < n; j++) {
                if (arr[j] > max) {
                    max = arr[j];
                }
            }
            arr[i] = max;
        }
        for (int i = 0; i < n; i++) {
            System.out.print(arr[i] + " ");
        }
    }
}
```

}

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Alex is a treasure hunter who collects valuable items during their quests. Each item has a specific point value, and Alex wants to maximize their score by strategically removing items one at a time.

The rule is simple: Alex removes the item with the highest point value in each step until no items are left, summing the values of the removed items to calculate the maximum score.

Help Alex to complete his task.

#### ***Input Format***

The first line of input consists of an integer N, representing the size of the array.

The second line of input consists of N space-separated integers, representing the point values of the items.

#### ***Output Format***

The output prints "Maximum Sum: " followed by the calculated maximum score after removing all items.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 14

7 14 21 28 35 42 49 56 63 70 77 84 91 98

Output: Maximum Sum: 735

#### ***Answer***

```
import java.util.*;  
public class Main{
```

```

public static void main(String[] args){
    Scanner s=new Scanner(System.in);
    int n=s.nextInt();
    int[] a=new int[n];
    int sum=0;
    for(int i=0;i<n;i++){
        a[i]=s.nextInt();
    }
    for(int i=0;i<n;i++){
        sum+=a[i];
    }
    System.out.println("Maximum Sum: "+sum);
}
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement:

Imagine you have an array of integer values, and you're tasked with identifying a pair of elements within the array. This pair of elements should have a sum that is the closest to zero when compared to any other pair in the array.

Your goal is to create a program that solves this problem efficiently. The program should accept an array of integers and return the pair of elements whose sum is closest to zero.

##### **Input Format**

The first line of the input is an integer N representing the size of the array.

The second line of the input contains N space-separated integer values.

##### **Output Format**

The output is displayed in the following format:

"Pair with the sum closest to zero: {value} and {value}"

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 5

9 10 -3 -5 -2

Output: Pair with the sum closest to zero: 9 and -5

### Answer

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int n = s.nextInt();
        int[] arr = new int[n];
        for (int i = 0; i < n; i++) {
            arr[i] = s.nextInt();
        }
        int minSum = Integer.MAX_VALUE;
        int first = 0, second = 0;
        for (int i = 0; i < n - 1; i++) {
            for (int j = i + 1; j < n; j++) {
                int sum = arr[i] + arr[j];
                if (Math.abs(sum) < Math.abs(minSum)) {
                    minSum = sum;
                    first = arr[i];
                    second = arr[j];
                }
            }
        }
        System.out.println("Pair with the sum closest to zero: " + first + " and " +
second);
    }
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 4\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 13

#### Section 1 : MCQ

1. What will be the output of the following code?

```
class Main {  
    public static void main(String args[]) {  
        String s1 = "Hello i love java";  
        String s2 = new String(s1);  
        System.out.println((s1 == s2) + " " + s1.equals(s2));  
    }  
}
```

**Answer**

false true

**Status :** Correct

**Marks :** 1/1

2. Predict the output for the following code.

```
public class Main {  
    public static void main(String[] args) {  
        String a = "java";  
        char temp = a.charAt(1);  
        System.out.println(temp);  
    }  
}
```

**Answer**

a

**Status :** Correct

**Marks :** 1/1

3. Predict the output for the following code:

```
public class Main {  
    public static void main(String[] args) {  
        float a = 10.0f;  
        String temp = Float.toString(a);  
        System.out.println(temp);  
    }  
}
```

**Answer**

10.0

**Status :** Correct

**Marks :** 1/1

4. What will be the output for the following code?

```
class Main {  
    public static void main(String[] args) {  
        String languages[] = { "C", "C++", "Java", "Python", "Ruby"};  
        for (String sample: languages) {  
            System.out.println(sample);  
        }  
    }  
}
```

}

**Answer**

CC++JavaPythonRuby

**Status :** Correct

**Marks :** 1/1

5. What will be the output of the following program?

```
class Main {  
    public static void main(String[] args) {  
        String greet = "Welcome\n";  
        System.out.print("String: " + greet);  
        int length = greet.length();  
        System.out.print("Length: " + length);  
    }  
}
```

**Answer**

String: WelcomeLength: 7

**Status :** Wrong

**Marks :** 0/1

6. What will be the output of the following code?

```
class Main {  
    public static void main(String args[]) {  
        char c[] = {'j', 'a', 'v', 'a'};  
        String s1 = new String(c);  
        String s2 = new String(s1);  
        System.out.println(s1);  
        System.out.println(s2);  
    }  
}
```

**Answer**

javajava

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following program?

```
class Main {  
    public static void main(String[] args) {  
        String s = new String("5");  
        System.out.println(1 + 1111 + s + 1 + 1010);  
    }  
}
```

**Answer**

1112511010

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following program?

```
class Main {  
    public static void main(String args[]) {  
        StringBuffer sb = new StringBuffer("Hello");  
        System.out.println("buffer = " + sb);  
        System.out.println("length = " + sb.length());  
        System.out.println("capacity = " + sb.capacity());  
    }  
}
```

**Answer**

buffer = Hello  
length = 5  
capacity = 21

**Status :** Correct

**Marks :** 1/1

9. What will be the output of the following program?

```
class Main {  
    public static void main(String args[]) {  
        String name="Work Hard";  
        name.concat("Success");  
        System.out.println(name);  
    }  
}
```

**Answer**

Work HardSuccess

**Status : Wrong**

**Marks : 0/1**

10. What will be the output of the following program?

```
class Main {  
    public static void main(String[] args) {  
        String s1 = "EDUCATION";  
        String s2 = new String("EDUCATION");  
        String s3 = "EDUCATION";  
        if (s1 == s2) {  
            System.out.println("s1 and s2 equal");  
        }  
        else {  
            System.out.println("s1 and s2 not equal");  
        }  
        if (s1 == s3) {  
            System.out.println("s1 and s3 equal");  
        }  
        else {  
            System.out.println("s1 and s3 not equal");  
        }  
    }  
}
```

**Answer**

s1 and s2 not equals1 and s3 equal

**Status : Correct**

**Marks : 1/1**

11. Predict the output for the following code.

```
class Main {  
    public static void main(String[] fruits) {  
        String fruit1 = new String("apple");  
        String fruit2 = new String("orange");  
    }  
}
```

```
String fruit3 = new String("pear");
fruit3 = fruit1;
fruit2 = fruit3;
fruit1 = fruit2;
System.out.println(fruit1);
System.out.println(fruit2);
System.out.println(fruit3);
    }
}
```

**Answer**

appleappleapple

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following program?

```
public class Main {
    public static void main(String[] args) {
        String str = "1234.34";
        int a = Integer.parseInt(str);
        System.out.println(a);
    }
}
```

**Answer**

NumberFormatException

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
class Main {
    public static void main(String args[])
    {
        StringBuffer sb = new StringBuffer("Hello");
        System.out.println("buffer before = " + sb);
        System.out.println("charAt(1) before = " + sb.charAt(1));
        sb.setCharAt(1, 'i');
    }
}
```

```
        sb.setLength(2);
        System.out.println("buffer after = " + sb);
        System.out.println("charAt(1) after = " + sb.charAt(1));
    }
}
```

**Answer**

buffer before = Hello charAt(1) before = e buffer after = Hi charAt(1) after = i

**Status :** Correct

**Marks :** 1/1

14. Predict the output for the following code:

```
class Main {
    public static void main(String args[]) {
        StringBuffer sb = new StringBuffer("I Java!");
        sb.insert(5, "like ");
        System.out.println(sb);
    }
}
```

**Answer**

I Javlike a!

**Status :** Correct

**Marks :** 1/1

15. What is the output of the following code?

```
class Main
{
    public static void main(String args[])
    {
        StringBuffer c = new StringBuffer("Hello");
        c.delete(0,2);
        System.out.println(c);
    }
}
```

**Answer**

Ilo

Status : Correct

### 2028\_REC\_OOPS using Java\_Week 4\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

In a publishing company, editors often need to quickly analyze passages of text to check for punctuation usage. To assist them, you are asked to write a program that counts the number of specific punctuation marks in each passage.

The punctuation marks of interest are:

Commas (,) Periods (.) Question marks (?)

##### ***Input Format***

The first line of input contains an integer T, representing the number of test cases (passages).

Each of the next T lines contains a single passage of text.

### **Output Format**

For each test case, print three integers separated by spaces, representing the number of commas, periods, and question marks in the passage.

The first line of output corresponds to the first passage, the second line to the second passage, and so on.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

Hello, world. How are you?

Output: 1 1 1

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int T = Integer.parseInt(s.nextLine());
        for (int i = 0; i < T; i++) {
            String passage = s.nextLine();
            int comma = 0;
            int period = 0;
            int questionMark = 0;
            for (int j = 0; j < passage.length(); j++) {
                char ch = passage.charAt(j);
                if (ch == ','){
                    comma++;
                }
                else if (ch == '.'){
                    period++;
                }
                else if (ch == '?'){
                    questionMark++;
                }
            }
            System.out.println(comma + " " + period + " " + questionMark);
        }
    }
}
```

##### 1. Problem Statement

Anu is developing a tool for a conference registration system. Participants submit keywords related to their fields of interest. The organizer wants to sort these keywords alphabetically to generate tags for session grouping.

Write a program that accepts at least five keywords as input arguments and outputs them in sorted alphabetical order.

##### ***Input Format***

The first line of input contains an integer n, representing the number of keywords.

The second line of input contains n space-separated keywords (string).

##### ***Output Format***

The output prints n space separated strings representing the sorted keyword in alphabetical order.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

Blockchain Cloud AI Data Cybersecurity

Output: AI Blockchain Cloud Cybersecurity Data

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int n = Integer.parseInt(s.nextLine());
        String[] keywords = s.nextLine().split(" ");
        for (int i = 0; i < n - 1; i++) {
            for (int j = 0; j < n - 1 - i; j++) {
                if (keywords[j].compareTo(keywords[j + 1]) > 0) {

##### 1. Problem Statement

Bechan Chacha is seeking help to filter out valid mobile numbers from a list provided by his crush. He can only pick his crush's number if the list contains valid mobile numbers.

A mobile number is considered valid if:

It has exactly 10 digits. It consists only of numeric values (0–9). It does not begin with zero.

Your task is to determine whether each mobile number in the list is valid or not.

##### ***Input Format***

The first line contains an integer T, representing the number of mobile numbers

to check.

The next T lines each contain a string S, representing a mobile number.

### **Output Format**

For each mobile number S, the output print "YES" if it is valid.

Otherwise, print "NO".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

9876543210

Output: YES

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int n = Integer.parseInt(s.nextLine());
        for (int i = 0; i < n; i++) {
            String mobileNumber = s.nextLine().trim();
            if (mobileNumber.length() == 10 && mobileNumber.matches("[0-9]+") &&
                mobileNumber.charAt(0) != '0') {
                System.out.println("YES");
            }
            else{
                System.out.println("NO");
            }
        }
    }
}
```

##### 1. Problem Statement

Arjun is learning how to filter words from a sentence based on grammar rules. He wants to identify the valid words in a sentence.

A word is considered valid if it satisfies all these conditions:

The word contains only alphabets (a-z, A-Z). The word length is at least 2 characters. The word should not contain digits or special characters.

Your task is to read a sentence and print all the valid words in it.

##### ***Input Format***

The input contains a single line containing a sentence S.

##### ***Output Format***

The output prints all the valid words separated by spaces.

If no valid word exists, print "No valid words."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Hello world1 123 ab" @\$ Hi

Output: Hello Hi

### **Answer**

```
import java.util.Scanner;
import java.util.ArrayList;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String sentence = s.nextLine();
        String[] words = sentence.split("\\s+");
        ArrayList<String> validWords = new ArrayList<>();
        for (String word : words) {
            if (word.length() >= 2 && word.matches("[a-zA-Z]+")) {
                validWords.add(word);
            }
        }
        if (validWords.isEmpty()) {
            System.out.println("No valid words.");
        }
        else{
            System.out.println(String.join(" ", validWords));
        }
    }
}
```

#### Section 1 : Coding

##### 1. Problem Statement

In a secure banking system, customers are required to create PIN codes for accessing their accounts. The bank wants to validate these PIN codes before accepting them.

A PIN code is considered valid if:

It consists of exactly 4 digits. All characters must be numeric (0–9). It cannot contain all identical digits (e.g., 1111 is invalid).

Your task is to determine whether each PIN code in the list is valid or not.

##### ***Input Format***

The first line of input contains an integer T, representing the number of PIN codes to check.

The next T lines each contain a string S, representing a PIN code.

### **Output Format**

For each PIN code S, the output print "YES" if it is valid.

Otherwise, the output print "NO".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1234

Output: YES

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int T = Integer.parseInt(s.nextLine());
        for (int i = 0; i < T; i++) {
            String pin = s.nextLine();
            boolean isValid = true;
            if (pin.length() != 4) {
                isValid = false;
            }
            else{
                for (int j = 0; j < 4; j++){
                    if (!Character.isDigit(pin.charAt(j))){
                        isValid = false;
                        break;
                    }
                }
            }
            if (isValid){
                char first = pin.charAt(0);
                if (pin.charAt(1) == first && pin.charAt(2) == first && pin.charAt(3) ==
first){
                    isValid = false;
                }
            }
        }
    }
}
```

```
    }  
    }  
    }  
    if (isValid){  
        System.out.println("YES");  
    }  
    else{  
        System.out.println("NO");  
    }  
    }  
    }  
}

### REC\_2028\_OOPS using Java\_Week 4\_PAH

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement

Ravi is analyzing text messages for his research on typing patterns. He wants to count the number of uppercase letters, lowercase letters, and digits in a sentence to understand typing trends.

Your task is to help Ravi by writing a program that takes a sentence and prints the count of uppercase letters, lowercase letters, and digits.

##### ***Input Format***

The input contains a single line containing a sentence (string).

##### ***Output Format***

The output prints three integers separated by spaces:

- Number of uppercase letters
- Number of lowercase letters
- Number of digits

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Hello World 123

Output: 2 8 3

### **Answer**

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String input = s.nextLine();
        int upper = 0;
        int lower = 0;
        int digit = 0;
        for (int i = 0; i < input.length(); i++) {
            char ch = input.charAt(i);
            if (Character.isUpperCase(ch)) {
                upper++;
            }
            else if (Character.isLowerCase(ch)){
                lower++;
            }
            else if (Character.isDigit(ch)){
                digit++;
            }
        }
        System.out.println(upper + " " + lower + " " + digit);
    }
}
```

**Status :** Correct

## **2. Problem Statement**

Sana is analyzing text for a secret code. She wants to find all words in a sentence that start and end with the same letter. These words are considered "special words" for her analysis.

Your task is to write a program that extracts and prints all words that start and end with the same letter (case-insensitive).

If no such word exists, print "No special words found".

### ***Input Format***

The input contains a single line containing a sentence with multiple words.

### ***Output Format***

The output prints all words that start and end with the same letter separated by a space.

If no word satisfies the condition, print "No special words found".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: Anna went to the civic center

Output: Anna civic

### ***Answer***

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String sen = s.nextLine();
        String[] words = sen.split(" ");
        boolean found = false;
        for (String word : words){
            if (word.length() > 0){
                String lowerWord = word.toLowerCase();
                char first = lowerWord.charAt(0);
                char last = lowerWord.charAt(lowerWord.length() - 1);
```

```
        if (first == last){
            System.out.print(word + " ");
            found = true;
        }
    }
}
if (!found) {
    System.out.println("No special words found");
}
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

At a digital library, the system needs to analyze passages to identify the frequency of vowels, since they are key for linguistic research. You are asked to write a program that counts the number of vowels in each passage of text.

The vowels of interest are:

a, e, i, o, u (both uppercase and lowercase).

#### **Input Format**

The first line of input contains an integer T, representing the number of test cases (passages).

Each of the next T lines contains a single passage of text.

#### **Output Format**

For each test case, print a single integer representing the total number of vowels in the passage.

The first line of output corresponds to the first passage, the second line to the second passage, and so on.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1  
Hello World  
Output: 3

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args){
        Scanner s = new Scanner(System.in);
        int T = s.nextInt();
        s.nextLine();
        for (int t = 0; t < T; t++){
            String passage = s.nextLine();
            int vowel = 0;
            for (int i = 0; i < passage.length(); i++){
                char ch = Character.toLowerCase(passage.charAt(i));
                if (ch == 'a' || ch == 'e' || ch == 'i' || ch == 'o' || ch == 'u') {
                    vowel++;
                }
            }
            System.out.println(vowel);
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

## **4. Problem Statement**

Riya is preparing a puzzle game for her friends. She wants to include a feature that highlights special words in a sentence – specifically, palindromic words (words that read the same forward and backward).

Your task is to help Riya by writing a program that extracts all palindrome words from the given sentence. If there are no palindromes, print "No palindromes found".

### ***Input Format***

The input contains a single string S representing a sentence.

### ***Output Format***

The output prints all palindromic words separated by a space.

If no palindrome exists, print "No palindromes found".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: madam went to school

Output: madam

### ***Answer***

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String sen = s.nextLine();
        String[] words = sen.split(" ");
        boolean found = false;
        for (String word : words){
            boolean isPalindrome = true;
            int length = word.length();
            for (int i = 0; i < length / 2; i++) {
                if (word.charAt(i) != word.charAt(length - 1 - i)){
                    isPalindrome = false;
                    break;
                }
            }
            if (isPalindrome){
                System.out.print(word + " ");
                found = true;
            }
        }
        if (!found){
            System.out.println("No palindromes found");
        }
    }
}
```

### REC\_2028\_OOPS using Java\_Week 4\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement

Anjali is preparing a report on text complexity. She wants to identify all words in a sentence that contain at least one digit so she can analyze numeric mentions.

Your task is to write a program that extracts and prints all words containing at least one digit from a given sentence.

If no such word exists, print "No words with digits found".

##### ***Input Format***

The input contains a single line containing a sentence with multiple words.

##### ***Output Format***

The output prints all words containing at least one digit separated by a space.

If no word contains a digit, print "No words with digits found".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: The model X100 and Y200 are available

Output: X100 Y200

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();
        String[] words = sentence.split(" ");
        StringBuilder result = new StringBuilder();
        for (String word : words){
            boolean hasDigit = false;
            for (int i = 0; i < word.length(); i++) {
                if (Character.isDigit(word.charAt(i))) {
                    hasDigit = true;
                    break;
                }
            }
            if (hasDigit) {
                if (result.length() > 0){
                    result.append(" ");
                }
                result.append(word);
            }
        }
        if (result.length() > 0) {
            System.out.println(result.toString());
        }
        else{
            System.out.println("No words with digits found");
        }
    }
}
```

```
        sc.close();  
    }  
}
```

**Marks :** 10/10

## 2. Problem Statement

In a university library, librarians need to track the usage of special characters in students' notes.

To help them, you are asked to write a program that counts the number of specific symbols in each passage of text.

The symbols of interest are:

Exclamation marks (!) Colons (:) Semicolons (;)

### **Input Format**

The first line of input contains an integer T, representing the number of test cases (passages).

Each of the next T lines contains a single passage of text.

### **Output Format**

For each test case, print three integers separated by spaces, representing the number of exclamation marks, colons, and semicolons in the passage.

The first line of output corresponds to the first passage, the second line to the second passage, and so on.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

Hello! How are you

Output: 1 0 0

### Answer

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner s =new Scanner(System.in);
        int T=s.nextInt();
        s.nextLine();
        for(int i=0;i<T;i++){
            String str=s.nextLine();
            int exclamation_count=0;
            int colon_count=0;
            int semicolon_count=0;
            for(int j=0;j<str.length();j++){
                char c=str.charAt(j);
                if(c=='!')
                    exclamation_count++;
                else if(c==':')
                    colon_count++;
                else if(c==';')
                    semicolon_count++;
            }
            System.out.println(exclamation_count+" "+colon_count+"
"+semicolon_count);
        }
    }
}
```

Status : Correct

Marks : 10/10

### 3. Problem Statement

In a college, students are required to create unique usernames for accessing the digital library.

The librarian needs your help to verify whether the usernames entered by students are valid.

A username is considered valid if:

It contains only letters (a–z, A–Z) and digits (0–9). Its length is between 5

and 15 characters (inclusive). It must start with a letter (not a digit).

Your task is to determine whether each username in the list is valid or not.

### ***Input Format***

The first line of input contains an integer T, representing the number of usernames to check.

The next T lines each contain a string S, representing a username.

### ***Output Format***

For each username S, the output print "YES" if it is valid.

Otherwise, the output print "NO".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

Alice123

Output: YES

### ***Answer***

```
import java.util.Scanner;
public class Main{
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        int T = s.nextInt();
        s.nextLine();
        for (int i = 0; i < T; i++) {
            String username = s.nextLine();
            boolean isValid = true;
            if (username.length() < 5 || username.length() > 15) {
                isValid = false;
            }
            else if (!Character.isLetter(username.charAt(0))) {
                isValid = false;
            }
        }
    }
}
```

```

else {
    for (int j = 0; j < username.length(); j++) {
        char c = username.charAt(j);
        if (!Character.isLetterOrDigit(c)) {
            isValid = false;
            break;
        }
    }
}
if (isValid) {
    System.out.println("YES");
}
else{
    System.out.println("NO");
}
}
}
}
}

```

**Marks :** 10/10

#### 4. Problem Statement

Riya is preparing for a vocabulary test. Her teacher told her to focus on long words in her practice sentences, specifically words that have at least 5 letters.

Riya wants to write a program that will help her identify such words quickly.

Your task is to help Riya by printing all the words in a given sentence that have a length greater than or equal to 5.

If no such word exists, display "No long words found".

##### **Input Format**

The input contains a single line containing a sentence with multiple words.

##### **Output Format**

The output prints all words having length  $\geq 5$ , separated by a space.

If no such word is found, print "No long words found".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: The quick brown fox jumps over the lazy dog

Output: quick brown jumps

### **Answer**

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        String sen = s.nextLine();
        String[] words = sen.split(" ");
        boolean found = false;
        for (String word : words) {
            if (word.length() >= 5) {
                System.out.print(word + " ");
                found = true;
            }
        }
        if (!found) {
            System.out.println("No long words found");
        }
        else {
            System.out.println();
        }
    }
}
```

1. What will be the output of the following code?

```
class Box {  
    int volume(int l, int b, int h) {  
        return l * b * h;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Box b = new Box();  
        System.out.println(b.volume(2, 3, 4));  
    }  
}
```

**Answer**

24

Status : Correct

Marks : 1/1

2. What is the output of the following code?

```
class Box {  
    int height;  
    Box(int height) {  
        this.height = height;  
    }  
    void modifyHeight(Box b) {  
        b.height += 10;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Box b1 = new Box(20);  
        b1.modifyHeight(b1);  
        System.out.println(b1.height);  
    }  
}
```

Answer

30

Status : Correct

Marks : 1/1

3. What will be the output of the following code?

```
class Person {  
    String name;  
    void setName(String n) {  
        name = n;  
    }  
    void printName() {  
        System.out.println(name);  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        Person p = new Person();  
        p.printName();  
    }  
}
```

**Answer**

null

**Status :** Correct

**Marks :** 1/1

4. What will be the output of the following code?

```
class Demo {  
    void printMessage() {  
        System.out.println("Hello from Demo");  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Demo d = new Demo();  
        d.printMessage();  
    }  
}
```

**Answer**

Hello from Demo

**Status :** Correct

**Marks :** 1/1

5. What will be the output of the following code?

```
class A {  
    int y = 30;  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        A a1 = new A();  
        A a2 = new A();  
        a1.y = 50;  
        System.out.println(a2.y);  
    }  
}
```

**Answer**

30

**Status :** Correct

**Marks :** 1/1

6. What will be the output of the following code?

```
class Alpha {  
    void greet(String name) {  
        System.out.println("Hello " + name);  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Alpha obj = new Alpha();  
        obj.greet("Anu");  
    }  
}
```

**Answer**

Hello Anu

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following code?

```
class Ball {  
    int size = 11;  
}
```

```
class Game {  
    public static void main(String[] args) {  
        Ball b1 = new Ball();  
        Ball b2 = new Ball();  
        b2.size = 10;  
        System.out.println(b1.size);  
    }  
}
```

**Answer**

11

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following code?

```
class A {  
    int val = 20;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.val += 5;  
        System.out.println(obj1.val);  
    }  
}
```

**Answer**

25

**Status :** Correct

**Marks :** 1/1

9. What will be the output of the following code?

```
class Sample {  
    int x = 10;
```

```
void display() {  
    System.out.println("x = " + x);  
}  
  
public static void main(String[] args) {  
    Sample s = new Sample();  
    s.display();  
}  
}
```

**Answer**

x = 10

**Status :** Correct

**Marks :** 1/1

10. What will be the output of the following code?

```
class A {  
    int p = 5;  
    int q = 2;  
}  
  
class Main {  
    public static void main(String[] args) {  
        A obj = new A();  
        System.out.println(obj.p + obj.q);  
    }  
}
```

**Answer**

7

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following code?

```
class A {  
    int x = 50;
```

```
}  
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.x = 100;  
        System.out.println(obj1.x);  
    }  
}
```

**Answer**

100

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
class Person {  
    int age = 18;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Person p = new Person();  
        p.age += 2;  
        System.out.println("Age: " + p.age);  
    }  
}
```

**Answer**

Age: 20

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
class Test {  
    private int value;
```

```
Test(int value) {  
    this.value = value;  
}  
public int getValue() {  
    return value;  
}  
}  
public class Main {  
    public static void main(String[] args) {  
        Test obj = new Test(10);  
        System.out.println(obj.value);  
    }  
}
```

**Answer**

Compile-time error

**Status :** Correct

**Marks :** 1/1

14. What will be the output of the following code?

```
class MathUtils {  
    int add(int x) {  
        return x + x;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        MathUtils m = new MathUtils();  
        System.out.println(m.add(5));  
    }  
}
```

**Answer**

10

**Status :** Correct

**Marks :** 1/1

15. What will be the output of the following code?

```
class Box {  
    int length = 5;  
    int width = 4;  
  
    int area() {  
        return length * width;  
    }  
  
    public static void main(String[] args) {  
        Box b = new Box();  
        System.out.println("Area = " + b.area());  
    }  
}
```

**Answer**

Area = 20

**Status :** Correct

**Marks :** 1/1

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 5\_Q2

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

You are working as a developer for CityBank, which wants to build a basic account management system.

Each customer at the bank has:

An Account Number (integer) A Customer Name (string) An Initial Balance (double)

The bank allows two types of transactions:

Deposit – increases the balance. Withdrawal – decreases the balance only if enough funds are available.

If the withdrawal amount is greater than the balance, the withdrawal should not happen, and the balance should remain the same.

You are required to implement this system using:

A class with attributes for account details. A constructor to initialize account details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's account details after all transactions.

### ***Input Format***

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the account number (integer).
- The following line contains the customer name (string).
- The next line contains the initial balance (double).
- The next line contains the deposit amount (double).
- The next line contains the withdrawal amount (double).

### ***Output Format***

For each customer, print the details in the following format:

1. Account Number: <account\_number>
2. Customer Name: <customer\_name>
3. Final Balance: <final\_balance> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

1234

Rahul Sharma

5000

2000

3000

Output: Account Number: 1234

Customer Name: Rahul Sharma

Final Balance: 4000.0

### Answer

```
import java.util.Scanner;
class Account{
    private int accountNumber;
    private String customerName;
    private double balance;
    public Account(int accountNumber, String customerName, double
initialBalance){
        this.accountNumber = accountNumber;
        this.customerName = customerName;
        this.balance = initialBalance;
    }
    public void setAccountNumber(int accountNumber){
        this.accountNumber = accountNumber;
    }
    public void setCustomerName(String customerName){
        this.customerName = customerName;
    }
    public void setBalance(double balance){
        this.balance = balance;
    }
    public int getAccountNumber(){
        return accountNumber;
    }
    public String getCustomerName(){
        return customerName;
    }
    public double getBalance(){
        return balance;
    }
    public void deposit(double amount){
        balance += amount;
    }
    public void withdraw(double amount){
        if (amount <= balance){
            balance -= amount;
        }
    }
    public void displayDetails(){
        System.out.println("Account Number: " + accountNumber);
    }
}
```

```
        System.out.println("Customer Name: " + customerName);
        System.out.println("Final Balance: " + String.format("%.1f", balance));
    }
}
public class Main
{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        for (int i = 0; i < n; i++){
            int accountNumber = Integer.parseInt(sc.nextLine());
            String customerName = sc.nextLine();
            double initialBalance = Double.parseDouble(sc.nextLine());
            double depositAmount = Double.parseDouble(sc.nextLine());
            double withdrawalAmount = Double.parseDouble(sc.nextLine());
            Account acc = new Account(accountNumber, customerName,
initialBalance);
            acc.deposit(depositAmount);
            acc.withdraw(withdrawalAmount);
            acc.displayDetails();
        }
    }
}
```

##### 1. Problem Statement

Neha is working as a developer for CityElectricity Board, which wants to build a household electricity billing system.

Each customer's electricity account has:

A Customer ID (integer) A Customer Name (string) Units Consumed (double)

The electricity bill is calculated based on these rules:

For the first 100 units 5 units charge per unit For the next 100 units (101–200) 7 units charge per unit For units above 200 10 units charge per unit If the total bill exceeds 2000 units, a 5% discount is applied on the final bill.

Neha has been asked to implement this system using:

A class with attributes for customer details. A constructor to initialize customer details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

### ***Input Format***

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Units Consumed (double).

### ***Output Format***

For each customer, print the details in the following format:

Customer ID: <customer\_id>

Customer Name: <customer\_name>

Final Bill: <final\_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

1001

Ravi Kumar

80

Output: Customer ID: 1001

Customer Name: Ravi Kumar

Final Bill: 400.0

### ***Answer***

```
import java.util.Scanner;
```

```
class Customer {

##### 1. Problem Statement

Ravi is working as a developer for SecureLogin Systems, which wants to build a system to evaluate the strength of user passwords.

Each user record has:

User ID (integer) User Name (string) Password (string)

The system must calculate whether a password is strong or weak.

A password is considered strong if it meets all of the following conditions:

At least 8 characters long. Contains at least one uppercase letter. Contains at least one lowercase letter. Contains at least one digit. Contains at least one special character (from !@#\$%^&\*).

Ravi has been asked to implement this system using:

A class with attributes for user details. A constructor to initialize user details. Getter and setter methods to retrieve or update user details. A method to check whether the password is strong. Objects of the class to represent users.

Finally, display each user's details and indicate whether their password is Strong or Weak.

### ***Input Format***

The first line contains an integer N, representing the number of users.

For each user:

The next line contains the User ID (integer).

The next line contains the User Name (string).

The next line contains the Password (string).

### ***Output Format***

For each user, print the details in the following format:

User ID: <user\_id>

User Name: <user\_name>

Password: <password>

Password Strength: <Strong/Weak>

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

1001

Ravi Kumar

Abc@1234

Output: User ID: 1001

User Name: Ravi Kumar

Password: Abc@1234

Password Strength: Strong

### **Answer**

```
import java.util.Scanner;
class User{
    private int userId;
    private String userName;
    private String password;
    public User(int userId, String userName, String password){
        this.userId = userId;
        this.userName = userName;
        this.password = password;
    }

        this.userId = userId;
    }
    public void setUserName(String userName){
        this.userName = userName;
    }
    public void setPassword(String password){
        this.password = password;
    }
    public int getUserId(){
        return userId;
    }
    public String getUserName(){
        return userName;
    }
    public String getPassword(){
        return password;
    }
    public String checkPasswordStrength(){
        if (password.length() < 8){
            return "Weak";
        }
        boolean hasUpper = false, hasLower = false, hasDigit = false, hasSpecial =
false;
        String specials = "!@#$%^&*";
```

```

    for (char c : password.toCharArray()){
        if (Character.isUpperCase(c)) hasUpper = true;
        else if (Character.isLowerCase(c)) hasLower = true;
        else if (Character.isDigit(c)) hasDigit = true;
        else if (specials.indexOf(c) != -1) hasSpecial = true;
    }
    if (hasUpper && hasLower && hasDigit && hasSpecial){
        return "Strong";
    }
    else{
        return "Weak";
    }
}

public void displayDetails(){
    System.out.println("User ID: " + userId);
    System.out.println("User Name: " + userName);
    System.out.println("Password: " + password);
    System.out.println("Password Strength: " + checkPasswordStrength());
}
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);

## 2. Problem Statement

Neha is working as a developer for CityQuiz Platform, which wants to build a system to calculate quiz scores and identify top scorers among participants.

Each participant's record has:

Participant ID (integer) Participant Name (string) An array of scores in 5 quiz rounds (integers, each between 0 and 100)

The system must calculate:

Total Score = sum of scores in all 5 rounds. Average Score = Total Score ÷ 5. If a participant scores above 80 in all rounds, a bonus of 10 points is added to the total score. Identify the Top Scorer among all participants. If two participants have the same total score, the one with the lower Participant ID is considered the top scorer.

Neha has been asked to implement this system using:

A class with attributes for participant details. A constructor to initialize participant details. Getter and setter methods to retrieve or update participant details. A method to calculate total score and average score (including bonus if applicable). Objects of the class to represent participants.

Finally, display each participant's details and announce the Top Scorer.

### ***Input Format***

The first line of input contains an integer N, representing the number of participants.

For each participant:

- Next line: Participant ID (integer)
- Next line: Participant Name (string)
- Next line: 5 integers separated by spaces (scores for 5 quiz rounds)

### ***Output Format***

For each participant:

- Participant ID: <participant\_id>
- Participant Name: <participant\_name>
- Total Score: <total\_score>
- Average Score: <average\_score>

Finally, print "Top Scorer: <participant\_name> with <total\_score> points"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1001

Ravi Kumar

85 90 88 92 87

Output: Participant ID: 1001

Participant Name: Ravi Kumar

Total Score: 452

Average Score: 90

Top Scorer: Ravi Kumar with 452 points

### **Answer**

```
import java.util.Scanner;
class Participant{
    private int participantId;
    private String participantName;
    private int[] scores;
    public Participant(int participantId, String participantName, int[] scores){
        this.participantId = participantId;
        this.participantName = participantName;
        this.scores = scores;
    }
    public void setParticipantId(int participantId){
        this.participantId = participantId;
    }
    public void setParticipantName(String participantName){
        this.participantName = participantName;
    }
    public void setScores(int[] scores){
        this.scores = scores;
    }
    public int getParticipantId(){
```

```

        return participantId;
    }
    public String getParticipantName(){
        return participantName;
    }
    public int[] getScores(){
        return scores;
    }
    public int calculateTotalScore(){
        int total = 0;
        boolean allAbove80 = true;
        for (int score : scores){
            total += score;
            if (score <= 80){
                allAbove80 = false;
            }
        }
        if (allAbove80){
            total += 10;
        }
        return total;
    }
    public int calculateAverageScore(){
        int total = calculateTotalScore();
        return total / 5;
    }
    public void displayDetails(){
        System.out.println("Participant ID: " + participantId);
        System.out.println("Participant Name: " + participantName);
        System.out.println("Total Score: " + calculateTotalScore());
        System.out.println("Average Score: " + calculateAverageScore());
    }
}

public class Main{

### 3. Problem Statement

Anjali is working as a developer for CityFitness Gym, which wants to build a system to calculate monthly membership fees for gym members based on the type of membership and the number of personal training sessions booked.

Each member's record has:

Member ID (integer) Member Name (string) Membership Type (string: "Basic", "Premium", "Elite") Number of Personal Training Sessions (integer)

The monthly fees are:

Basic – 1000 units Premium – 1500 units Elite – 2000 units

The cost of personal training sessions is 500 units per session.

The calculation rules:

Total Amount = Membership Fee + (Number of Personal Training Sessions × 500) If the number of sessions is more than 5, a 10% discount is applied on the total amount. If the member has Elite membership and the total amount exceeds 4000, an additional 5% service tax is added after discount.

Anjali has been asked to implement this system using:

A class with attributes for member details. A constructor to initialize member details. Getter and Setter methods to retrieve and update member details if required. A method to calculate the final monthly fee. Objects of the class to represent members.

Finally, display each member's details and the final monthly fee.

### **Input Format**

The first line contains an integer N, representing the number of members.

For each member:

- Next line contains Member ID (integer)
- Next line contains Member Name (string)
- Next line contains Membership Type ("Basic", "Premium", "Elite")
- Next line contains Number of Personal Training Sessions (integer)

### **Output Format**

For each member, print:

- Member ID: <member\_id>
- Member Name: <member\_name>
- Final Monthly Fee: <final\_fee> (The final fee must be rounded to one decimal place)

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1001

Ravi Kumar

Basic

3

Output: Member ID: 1001

Member Name: Ravi Kumar

Final Monthly Fee: 2500.0

**Answer**

```
import java.util.Scanner;
class Member{
    private int memberId;
    private String memberName;
    private String membershipType;
    private int numSessions;
    public Member(int memberId, String memberName, String membershipType,

#### 4. Problem Statement

Each customer at the bank has an Account Number, Customer Name, and an Initial Balance. The bank allows two types of transactions:

Deposit – Increases the balance. Withdrawal – Decreases the balance, but only if enough funds are available. If the withdrawal amount exceeds the available balance, the transaction should be skipped, and the balance should remain unchanged.

You are required to implement this banking system by:

Creating a class with the necessary attributes to store account details.

Using a constructor to initialize the account details when a new account is created. Providing setter methods to update the details if required. Providing getter methods to retrieve account details. Creating objects of this class to represent different customers, where each customer can perform deposits and withdrawals.

**Instructions:**

Implement the class to store account details. Implement the logic for performing deposit and withdrawal transactions. Ensure that withdrawals don't exceed the available balance. After performing the transactions, print the account number, customer name, and final balance.

#### ***Input Format***

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the account number (integer).

- The following line contains the customer name (string).
- The next line contains the initial balance (double).
- The next line contains the deposit amount (double).
- The next line contains the withdrawal amount (double).

### **Output Format**

For each customer, print the details in the following format:

1. Account Number: <account\_number>
2. Customer Name: <customer\_name>
3. Final Balance: <final\_balance> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1234

Rahul Sharma

5000

2000

3000

Output: Account Number: 1234

Customer Name: Rahul Sharma

Final Balance: 4000.0

### **Answer**

```
import java.util.Scanner;
class Account{
    private int accountNumber;
    private String customerName;
    private double balance;
    public Account(int accountNumber, String customerName, double balance){
        this.accountNumber = accountNumber;
        this.customerName = customerName;
        this.balance = balance
    }
    public void setAccountNumber(int accountNumber){
        this.accountNumber = accountNumber;
    }
}
```

```

    public void setCustomerName(String customerName){
        this.customerName = customerName;
    }
    public void setBalance(double balance){
        this.balance = balance;
    }
    public int getAccountNumber(){
        return accountNumber;
    }
    public String getCustomerName(){
        return customerName;
    }
    public double getBalance(){
        return balance;
    }
    public void deposit(double amount){
        this.balance += amount;
    }
    public void withdraw(double amount){
        if (amount <= balance){
            this.balance -= amount;
        }
    }
    public void displayDetails(){
        System.out.println("Account Number: " + accountNumber);
        System.out.println("Customer Name: " + customerName);
        System.out.println("Final Balance: " + String.format("%.1f", balance));
    }
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int N = Integer.parseInt(sc.nextLine());
        for (int i = 0; i < N; i++){
            int accountNumber = Integer.parseInt(sc.nextLine());
            String customerName = sc.nextLine();
            double initialBalance = Double.parseDouble(sc.nextLine());
            double depositAmount = Double.parseDouble(sc.nextLine());
            double withdrawalAmount = Double.parseDouble(sc.nextLine());
            Account account = new Account(accountNumber, customerName,
            initialBalance);
            account.deposit(depositAmount);

```

```
        account.withdraw(withdrawalAmount);
        account.displayDetails();
    }
}
```

## 5. Problem Statement

Neha is working as a developer for CityMovie Theatre, which wants to build a system to calculate total ticket cost for movie-goers based on the number of tickets and type of seats booked.

Each customer's booking has:

Booking ID (integer) Customer Name (string) Number of Tickets (integer) Seat Type (string: "Standard", "Premium", "VIP")

The ticket prices are:

Standard – 250 units per ticket Premium – 400 units per ticket VIP – 600 units per ticket

The calculation rules:

Total Amount = Number of Tickets × Seat Price

If a customer books more than 4 tickets, they get a 10% discount on the total amount.

If the booking is for VIP seats and the total amount exceeds 3000 units, a 5% luxury tax is added after any discount.

Neha has been asked to implement this system using:

A class with attributes for booking details. A constructor to initialize booking details. Getter and Setter methods to retrieve and update booking details if required. A method to calculate the final ticket cost. Objects of the class to represent bookings.

Finally, display each customer's details and final ticket amount.

### ***Input Format***

The first line contains an integer N, representing the number of bookings.

For each booking:

- The next line contains the Booking ID (integer).
- The next line contains the Customer Name (string).
- The next line contains Number of Tickets (integer).
- The next line contains Seat Type ("Standard", "Premium", or "VIP").

### ***Output Format***

For each booking, print:

- Booking ID: <booking\_id>
- Customer Name: <customer\_name>
- Final Ticket Amount: <final\_amount> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

1001

## 2. Problem Statement

Arjun is working as a developer for CityWater Supply Board, which wants to build a household water billing system.

Each household's water account has:

A Customer ID (integer) A Customer Name (string) Liters Consumed (double)

The water bill is calculated based on these rules:

For the first 500 liters    2 per liter For the next 500 liters (501–1000)    3 per liter  
For liters above 1000    5 per liter If the total bill exceeds 3000, a 10% discount is applied on the final bill.

Arjun has been asked to implement this system using:

A class with attributes for customer details. A constructor to initialize customer details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

### ***Input Format***

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Liters Consumed (double).

### ***Output Format***

For each customer, print the details in the following format:

Customer ID: <customer\_id>

Customer Name: <customer\_name>

Final Bill: <final\_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1001

Ravi Kumar

300

Output: Customer ID: 1001

Customer Name: Ravi Kumar

Final Bill: 600.0

### **Answer**

```
import java.util.Scanner;
class Customer{
    private int customerId;
    private String customerName;
    private double litersConsumed;
    public Customer(int customerId, String customerName, double
litersConsumed){
        this.customerId = customerId;
        this.customerName = customerName;
        this.litersConsumed = litersConsumed;
    }
    public void setCustomerName(String customerName){
        this.customerName = customerName;
    }
    public void setLitersConsumed(double litersConsumed){
        this.litersConsumed = litersConsumed;
    }
    public int getCustomerId(){
        return customerId;
    }
    public String getCustomerName(){
        return customerName;
    }
    public double getLitersConsumed(){
        return litersConsumed;
    }
    public double calculateBill(){
        double bill = 0;
        double liters = litersConsumed;
        if (liters > 1000){
```

```

        bill += (liters - 1000) * 5;
        liters = 1000;
    }
    if (liters > 500){
        bill += (liters - 500) * 3;
        liters = 500;
    }
    bill += liters * 2;
    if (bill > 3000){
        bill = bill * 0.9;
    }
    return bill;
}
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        Customer[] customers = new Customer[n];
        for (int i = 0; i < n; i++){
            int id = Integer.parseInt(sc.nextLine());
            String name = sc.nextLine();
            double liters = Double.parseDouble(sc.nextLine());
            customers[i] = new Customer(id, name, liters);
        }
        for (int i = 0; i < n; i++){
            double finalBill = customers[i].calculateBill();
            System.out.println("Customer ID: " + customers[i].getCustomerId());
            System.out.println("Customer Name: " +
customers[i].getCustomerName());
            System.out.printf("Final Bill: %.1f\n", finalBill);
        }
    }
}

```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

You are working as a developer for CityMobile, which wants to build a basic mobile data usage management system.

Each customer has:

A Customer ID (integer) A Customer Name (string) An Initial Data Balance (in GB, double)

The company allows two types of operations:

Recharge – increases the data balance. Usage – decreases the data balance only if enough data is available.

If the usage amount is greater than the available data balance, the usage should not happen, and the balance should remain the same.

You are required to implement this system using:

A class with attributes for customer details. A constructor to initialize customer details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's details after all operations.

### ***Input Format***

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Initial Data Balance (double).
- The next line contains the Recharge Amount in GB (double).
- The next line contains the Usage Amount in GB (double).

### ***Output Format***

For each customer, print the details in the following format:

Customer ID: <customer\_id>

Customer Name: <customer\_name>

Final Data Balance: <final\_data\_balance> GB (The final balance must be rounded

to one decimal place.)

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1234

Ravi Kumar

5.0

2.0

3.0

Output: Customer ID: 1234

Customer Name: Ravi Kumar

Final Data Balance: 4.0 GB

### **Answer**

```
import java.util.Scanner;
class Customer{
    private int customerId;
    private String customerName;
    private double dataBalance;
    public Customer(int id, String name, double balance) {
        this.customerId = id;
        this.customerName = name;
        this.dataBalance = balance;
    }
    public void setCustomerId(int id){
        customerId = id;
    }
    public void setCustomerName(String name){
        customerName = name;
    }
    public void setDataBalance(double balance){
        dataBalance = balance;
    }
    public int getCustomerId(){
        return customerId;
    }
    public String getCustomerName(){
```

```

        return customerName;
    }
    public double getDataBalance(){
        return dataBalance;
    }
    public void recharge(double amount){
        if (amount > 0)
            dataBalance += amount;
    }
    public void useData(double amount){
        if (amount <= dataBalance){
            dataBalance -= amount;
        }
    }
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int N = Integer.parseInt(sc.nextLine());
        Customer[] customers = new Customer[N];
        for (int i = 0; i < N; i++){
            int id = Integer.parseInt(sc.nextLine());
            String name = sc.nextLine();
            double initialBalance = Double.parseDouble(sc.nextLine());
            double rechargeAmount = Double.parseDouble(sc.nextLine());
            double usageAmount = Double.parseDouble(sc.nextLine());
            Customer customer = new Customer(id, name, initialBalance);
            customer.recharge(rechargeAmount);
            customer.useData(usageAmount);
            customers[i] = customer;
        }
        for (int i = 0; i < N; i++){
            System.out.println("Customer ID: " + customers[i].getCustomerId());
            System.out.println("Customer Name: " +
customers[i].getCustomerName());
            System.out.println("Final Data Balance: " + String.format("%.1f",
customers[i].getDataBalance()) + " GB");
        }
    }
}

```

**Status : Correct**

**Marks : 10/10**

#### 4. Problem Statement

Anjali is now working as a developer for the City Marathon Association, which wants to build a system to track and find the fastest runner among marathon participants.

Each runner's record has:

Runner ID (integer) Runner Name (string) An array of times (in minutes) taken in 5 marathon events (integers)

The system must calculate:

The average time of each runner (sum of all times / 5). Identify the fastest runner (the one with the lowest average time). If two or more runners have the same average time, the one with the lower Runner ID is considered the fastest runner.

Anjali has been asked to implement this system using:

A class with attributes for runner details. A constructor to initialize runner details. Getter and Setter methods to retrieve and update runner details if required. A method to calculate the average time. Objects of the class to represent runners.

Finally, display each runner's details and announce the Fastest Runner.

#### **Input Format**

The first line of input contains an integer N (number of runners).

For each runner:

- The next line contains the Runner ID (integer).
- The following line contains the Runner Name (string).
- The next line contains 5 integers separated by spaces (times in minutes for 5 marathon events).

#### **Output Format**

For each runner the output prints the following details:

- Runner ID: <runner\_id>

- Runner Name: <runner\_name>
- Average Time: <average\_time>

Finally, print "Fastest Runner: <runner\_name> with <average\_time> minutes"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

1001

Ravi Kumar

240 250 245 255 260

Output: Runner ID: 1001

Runner Name: Ravi Kumar

Average Time: 250

Fastest Runner: Ravi Kumar with 250 minutes

### **Answer**

```
import java.util.Scanner;
class Runner{
    private int runnerId;
    private String runnerName;
    private int[] times;
    public Runner(int id, String name, int[] times){
        this.runnerId = id;
        this.runnerName = name;
        this.times = times;
    }
    public int getRunnerId(){
        return runnerId;
    }
    public void setRunnerId(int id){
        runnerId = id;
    }
    public String getRunnerName(){
        return runnerName;
```

```

    }
    public void setRunnerName(String name){
        runnerName = name;
    }
    public int[] getTimes(){
        return times;
    }
    public void setTimes(int[] times){
        this.times = times;
    }
    public int getAverageTime(){
        int sum = 0;
        for (int t : times){
            sum += t;
        }
        return sum / times.length;
    }
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int N = Integer.parseInt(sc.nextLine());
        Runner[] runners = new Runner[N];
        int minAvg = Integer.MAX_VALUE;
        int fastestRunnerId = -1;
        String fastestRunnerName = "";
        for (int i = 0; i < N; i++){
            int id = Integer.parseInt(sc.nextLine());
            String name = sc.nextLine();
            String[] timeStrs = sc.nextLine().split(" ");
            int[] times = new int[5];
            for (int j = 0; j < 5; j++){
                times[j] = Integer.parseInt(timeStrs[j]);
            }
            Runner runner = new Runner(id, name, times);
            runners[i] = runner;
            int avg = runner.getAverageTime();
            if (avg < minAvg || (avg == minAvg && id < fastestRunnerId)){
                minAvg = avg;
                fastestRunnerId = id;
                fastestRunnerName = name;
            }
        }
    }
}

```

```
}  
    for (int i = 0; i < N; i++){  
        System.out.println("Runner ID: " + runners[i].getRunnerId());  
        System.out.println("Runner Name: " + runners[i].getRunnerName());  
        System.out.println("Average Time: " + runners[i].getAverageTime());  
    }  
    System.out.println("Fastest Runner: " + fastestRunnerName + " with " +  
minAvg + " minutes");  
    }  
}
```

### REC\_2028\_OOPS using Java\_Week 6\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 13

#### Section 1 : MCQ

1. What will be the output of the following Java program?

```
class Vehicle {  
    void start() {  
        System.out.println("Vehicle starts");  
    }  
}  
class Car extends Vehicle {  
  
    void start() {  
        System.out.println("Car starts");  
    }  
}  
class ElectricCar extends Car {  
    void start() {  
        System.out.println("Electric Car starts silently");  
    }  
}
```

```
    }  
}  
class Test {  
    public static void main(String[] args) {  
        Vehicle v = new ElectricCar();  
        v.start();  
    }  
}
```

**Answer**

Electric Car starts silently

**Status :** Correct

**Marks :** 1/1

2. What will be the output of the following code?

```
class A {  
    int sum(int x) {  
        return x + 2;  
    }  
}  
  
class B extends A {  
    int sum(int x) {  
        return super.sum(x) * 2;  
    }  
}  
  
class C extends B {  
    int sum(int x) {  
        return super.sum(x) - 3;  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        System.out.println(obj.sum(4));  
    }  
}
```

}

**Answer**

9

**Status :** Correct

**Marks :** 1/1

3. What will be the output of the following Java program?

```
class A {  
    void display() {  
        System.out.println("Class A");  
    }  
}  
  
class B extends A {  
    void show() {  
        System.out.println("Class B");  
    }  
}  
  
class C extends B {  
    void print() {  
        System.out.println("Class C");  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.display();  
        obj.show();  
        obj.print();  
    }  
}
```

**Answer**

Class AClass BClass C

**Status :** Correct

**Marks :** 1/1

4. Which of the following is the correct way for class B to inherit from class A?

**Answer**

class B extends A {}

**Status :** Correct

**Marks :** 1/1

5. What will be the output of the following Java program?

```
class Test {  
    void show(int a) {  
        System.out.println("Integer method");  
    }  
    void show(String s) {  
        System.out.println("String method");  
    }  
    public static void main(String[] args) {  
        Test obj = new Test();  
        obj.show(null);  
    }  
}
```

**Answer**

Compilation error due to ambiguous method call

**Status :** Wrong

**Marks :** 0/1

6. Which of the following is true about method overriding in Java?

**Answer**

The method must have the same name, same parameters, and must be in different classes with an inheritance relationship

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following Java program?

```

class Test {
    void display(int a, int b) {
        System.out.println("Method 1");
    }
    void display(double a, double b) {
        System.out.println("Method 2");
    }
    public static void main(String[] args) {
        Test obj = new Test();
        obj.display(10, 10.0);
    }
}

```

**Answer**

Method 2

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following Java program?

```

class A {
    int value = 10;
    void display() {
        System.out.println("A's display: " + value);
    }
}
class B extends A {
    int value = 20;
    void display() {
        System.out.println("B's display: " + value);
    }
}
class Test {
    public static void main(String[] args) {
        A obj = new B();
        obj.display();
        System.out.println("Value: " + obj.value);
    }
}

```

```
}
```

**Answer**

B's display: 20 Value: 10

**Status :** Correct

**Marks :** 1/1

9. What will be the output of the following program?

```
class A {  
    public int i;  
    private int j;  
}  
class B extends A {  
    void display() {  
        super.j = super.i + 1;  
        System.out.println(super.i + " " + super.j);  
    }  
}  
class inheritance {  
    public static void main(String args[]) {  
        B obj = new B();  
        obj.i=1;  
        obj.j=2;  
        obj.display();  
    }  
}
```

**Answer**

2 2

**Status :** Wrong

**Marks :** 0/1

10. What will be the output of the following program?

```
class Vehicle {  
    String type = "Vehicle";  
}
```

```
class Car extends Vehicle {
    String type = "Car";
}

class Test {
    public static void main(String[] args) {
        Car c = new Car();
        System.out.println(c.type);
    }
}
```

**Answer**

Car

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following Java program?

```
class Vehicle {
    void startEngine() {
        System.out.println("Vehicle engine started");
    }
}

class Car extends Vehicle {
    void startEngine() {
        System.out.println("Car engine started");
    }
}

class Main {
    public static void main(String[] args) {
        Vehicle myVehicle = new Car();
        myVehicle.startEngine();
    }
}
```

**Answer**

Car engine started

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following Java program?

```
class Parent {  
    void show() {  
        System.out.println("Parent class");  
    }  
}  
class Child extends Parent {  
    void show() {  
        System.out.println("Child class");  
    }  
}  
class Test {  
    public static void main(String[] args) {  
        Parent obj = new Child();  
        obj.show();  
    }  
}
```

**Answer**

Child class

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following program?

```
class A {  
    int x = 10;  
}  
  
class B extends A {  
    int x = 20;  
}  
  
class C extends B {  
    int x = 30;
```

```
void display() {  
    System.out.println(x);  
    System.out.println(super.x);  
}  
}  
  
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.display();  
    }  
}
```

**Answer**

3020

**Status :** Correct

**Marks :** 1/1

14. What will be the output of the following code?

```
class A {  
    void display() {  
        System.out.println("Display A");  
    }  
}  
  
class B extends A {  
    void display() {  
        System.out.println("Display B");  
    }  
}  
  
class C extends B {  
    void display() {  
        super.display();  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.display();  
    }  
}
```

**Answer**

Display B

**Status :** Correct

##### 1. Problem Statement

Elsa subscribes to a premium service with a base monthly cost, a service tax and an extra feature cost. Assist her in writing an inheritance program that takes input for these values and calculates the total monthly cost.

Refer to the below class diagram:

##### ***Input Format***

The first line of input consists of a double value, representing the base monthly cost.

The second line consists of a double value, representing the service tax.

The third line consists of a double value, representing the extra feature cost.

### **Output Format**

The output prints "Rs. X" where X is a double value, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 10.0

2.5

5.0

Output: Rs. 17.50

### **Answer**

```
import java.util.Scanner;
```

```
class Subscription{
```

```
    protected double baseMonthlyCost;
```

```
    // Constructor for the base class
```

```
    public Subscription(double baseMonthlyCost)
```

```
{
```

```
        this.baseMonthlyCost = baseMonthlyCost;
```

```
}
```

```
    // Method to return the base monthly cost
```

```
    public double getBaseMonthlyCost()
```

```
{
```

```
        return this.baseMonthlyCost;
    }
}
```

```
// Derived class PremiumSubscription
class PremiumSubscription extends Subscription
```

```
{
```

```
    private double serviceTax;
    private double extraFeatureCost;
```

```
    // Constructor for the derived class
    public PremiumSubscription(double baseMonthlyCost, double serviceTax,
    double extraFeatureCost)
```

```
{
```

```
    super(baseMonthlyCost); // Calling the base class constructor
    this.serviceTax = serviceTax;
    this.extraFeatureCost = extraFeatureCost;
```

```
}
```

```
    // Method to calculate the total monthly cost
    public double calculateMonthlyCost()
```

```
{
```

```
    return this.getBaseMonthlyCost() + this.serviceTax + this.extraFeatureCost;
```

```
}
```

```
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
  
        double baseMonthlyCost = scanner.nextDouble();  
        double serviceTax = scanner.nextDouble();  
        double extraFeatureCost = scanner.nextDouble();  
  
        PremiumSubscription premiumSubscription = new  
PremiumSubscription(baseMonthlyCost, serviceTax, extraFeatureCost);  
  
        double totalMonthlyCost = premiumSubscription.calculateMonthlyCost();  
  
        System.out.printf("Rs. %.2f%n", totalMonthlyCost);  
  
        scanner.close();  
    }  
}
```

##### 1. Problem Statement

Alice is managing an online store and wants to implement a program using inheritance to calculate the selling price of products after applying discounts.

Guide her by following the instructions:

Create a base class called Product with a public double attribute price. Create a subclass called DiscountedProduct, which extends Product and includes a private double attribute discount rate. This subclass has a method called calculateSellingPrice() to determine the final selling price after applying the discount.

Formula: Discounted selling price = price \* (1 - discount rate)

***Input Format***

The first line of input consists of a double value p, the initial price of the product.

The second line consists of a double value d, the discount rate.

### **Output Format**

The output prints "Rs. X", where X is a double value, representing the calculated discounted selling price, rounded off to two decimal places.

If the discount rate is greater than 1, print "Not applicable".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 50.00

0.20

Output: Rs. 40.00

### **Answer**

```
import java.util.Scanner;
```

```
class Product{  
    public double price;  
    public Product(double price){  
        this.price = price;  
    }  
}
```

```
class DiscountedProduct extends Product{  
    private double discountRate;  
    public DiscountedProduct(double price, double discountRate){  
        super(price);  
        this.discountRate = discountRate;  
    }  
    public double calculateSellingPrice(){  
        if (discountRate > 1){  
            return -1;  
        }  
        return price * (1 - discountRate);  
    }  
}
```

```
class ProductPricing {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double initialPrice = scanner.nextDouble();
        double discountRate = scanner.nextDouble();
        DiscountedProduct discountedProduct = new
DiscountedProduct(initialPrice, discountRate);
        double sellingPrice = discountedProduct.calculateSellingPrice();

        if (sellingPrice >= 0) {
            System.out.printf("Rs. %.2f%n", sellingPrice);
        } else {
            System.out.println("Not applicable");
        }
        scanner.close();
    }
}
```

##### 1. Problem Statement

Preethi is working on a project to automate sales tax calculations for items in a store. She wants to create a program that takes the price of an item and the sales tax rate as input and calculates the final price of the item after applying the sales tax.

Write a program using the class SalesTaxCalculator, which contains an overloaded method named calculateFinalPrice to handle both integer and double inputs. The program should also include a Main class that takes user input, calls the appropriate method from SalesTaxCalculator, and prints the final price of the item.

Formula Used: Final price = price + ((price \* sales tax rate) / 100)

**Input Format**

The first line of input consists of an integer price (the price of the item for integer inputs).

The second line of input consists of an integer taxRate (the sales tax rate for integer inputs).

The third line of input consists of a double price (the price of the item for double inputs).

The fourth line of input consists of a double taxRate (the sales tax rate for double inputs).

### ***Output Format***

The first line of output prints an integer, representing the final price of the item after applying the sales tax for integer inputs (a and b).

The second line prints a double value, representing the final price of the item after applying the sales tax for double-value inputs (m and n), rounded to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 100

10

100.0

5.0

Output: 110

105.00

### ***Answer***

```
import java.util.Scanner;  
class SalesTaxCalculator{
```

```
// Overloaded method for integer inputs
```

```

public static int calculateFinalPrice(int price, int taxRate)
{

    return price + (price * taxRate) / 100;

}

// Overloaded method for double inputs
public static double calculateFinalPrice(double price, double taxRate)
{

    return price + (price * taxRate) / 100.0;

}

}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int intPrice = scanner.nextInt();
        int intTaxRate = scanner.nextInt();
        double doublePrice = scanner.nextDouble();
        double doubleTaxRate = scanner.nextDouble();

        int finalPriceInt = SalesTaxCalculator.calculateFinalPrice(intPrice,
intTaxRate);
        double finalPriceDouble =
SalesTaxCalculator.calculateFinalPrice(doublePrice, doubleTaxRate);

        System.out.println(finalPriceInt);
        System.out.format("%.2f", finalPriceDouble);
    }
}

```

##### 1. Problem Statement

Mr.Kapoor wants to create a program to calculate the volume of a Cuboid and a Cube using method overriding.

Implements a base class Cuboid with attributes for length, width, and height. Include a method calculateVolume() that computes the volume of the cuboid.

Extends the base class with a subclass Cube representing a cube, where all sides are equal. Override the calculateVolume() method in the Cube class to compute the volume of the cube.

The program should take user input for the dimensions of the cuboid and the side length of the cube and display the calculated volumes with two decimal places.

### ***Input Format***

The first line of input consists of 3 space-separated double values, representing the cuboid length, width, and height, respectively.

The second line consists of a double value, representing the side length of the cube.

### ***Output Format***

The first line of output prints the volume of the cuboid, rounded off to two decimal places.

The second line prints the volume of the cube, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 60.0 60.0 60.0  
50.0

Output: Volume of Cuboid: 216000.00  
Volume of Cube: 125000.00

### ***Answer***

```
import java.util.Scanner;

class Cuboid{
    protected double length;
    protected double width;
    protected double height;
    public Cuboid(double length, double width, double height){
        this.length = length;
        this.width = width;
        this.height = height;
    }
    public double calculateVolume(){
        return length * width * height;
    }
}
```

```

class Cube extends Cuboid{
    private double side;
    public Cube(double side){
        super(side, side, side);
        this.side = side;
    }
    public double calculateVolume(){
        return side * side * side;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double cuboidLength = scanner.nextDouble();
        double cuboidWidth = scanner.nextDouble();
        double cuboidHeight = scanner.nextDouble();

        // Regular object instantiation for Cuboid
        Cuboid cuboid = new Cuboid(cuboidLength, cuboidWidth, cuboidHeight);
        System.out.printf("Volume of Cuboid: %.2f\n", cuboid.calculateVolume());

        double cubeSide = scanner.nextDouble();

        // Upcasting - Using superclass reference for subclass object (DMD)
        Cuboid cube = new Cube(cubeSide); // Upcasting
        System.out.printf("Volume of Cube: %.2f", cube.calculateVolume()); // Calls
        Cube's method dynamically

        scanner.close();
    }
}

##### 1. Problem statement:

Tim was tasked with developing a grocery shopping app. You have a class hierarchy that includes Item, Produce, and OrganicProduce. Your goal is to calculate the total cost of a shopping list, which may contain a mix of regular produce and organic produce items. Additionally, you need to apply discounts to organic items. Apply a 10% discount on organic produce items

Class Hierarchy:

Item: Base class for all items.

Produce: Subclass of Item for regular produce items.

OrganicProduce: Subclass of Produce for organic produce items.

### ***Input Format***

The first line of input consists of an integer, 'n'.

For each 'n' item, the user will provide:

- A string 'type' representing the item type ('Regular' or 'Organic').
- A string 'name' represents the item name.
- A double 'price' represents the item price.

### ***Output Format***

The output will display the total cost of the shopping list, including discounts on organic items.

Refer to the sample output for format specifications.

### ***Sample Test Case***

Input: 1

Regular Banana 1.99

Output: 1.99

### ***Answer***

```
import java.util.Scanner;

class Item{
    protected String name;
    protected double price;
    public Item(String name, double price){
        this.name = name;
        this.price = price;
    }
    public double calculateCost(){
        return price;
    }
}

class Produce extends Item{
    public Produce(String name, double price){
        super(name, price);
    }
}
```

```

    public double calculateCost(){
        return price;
    }
}

class OrganicProduce extends Produce{
    public OrganicProduce(String name, double price){
        super(name, price);
    }
    public double calculateCost(){
        return price * 0.9;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int n = sc.nextInt();
        sc.nextLine(); // Consume newline

        double totalCost = 0.0;

        for (int i = 0; i < n; i++) {
            String type = sc.next();
            String name = sc.next();
            double price = sc.nextDouble();

            if (type.equals("Regular")) {
                Item item = new Produce(name, price);
                totalCost += item.calculateCost();
            } else if (type.equals("Organic")) {
                Item item = new OrganicProduce(name, price);
                totalCost += item.calculateCost();
            }
        }

        System.out.printf("%.2f%n", totalCost);
    }
}

```

##### 1. Problem Statement

Sharon, a software developer, is working on a project to automate velocity calculations for various objects. She wants to create a class named VelocityCalculator with overloaded methods calculateVelocity to calculate the velocity. One method will accept distance in meters and time in seconds as integers, while another will accept distance and time as doubles.

Help her in completing the project.

Formula:  $\text{Velocity} = \text{distance} / \text{time}$

##### ***Input Format***

The first line of input consists of an integer, representing the distance in meters

(for the integer method).

The second line consists of an integer, representing the time in seconds (for the integer method).

The third line consists of a double value, representing the distance in meters (for the double method).

The fourth line consists of a double value, representing the time in seconds (for the double method).

### ***Output Format***

The first line prints the velocity calculated using the integer inputs in the format:

Velocity with integer inputs: <velocity> m/s

The second line prints the velocity calculated using the double inputs in the format:

Velocity with double inputs: <velocity> m/s

Note:

The velocity for the double inputs should be printed with two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 100

10

100.5

10.2

Output: Velocity with integer inputs: 10 m/s

Velocity with double inputs: 9.85 m/s

***Answer***

```

import java.util.Scanner;

class VelocityCalculator{
    public static int calculateVelocity(int distance, int time){
        return distance / time;
    }
    public static double calculateVelocity(double distance, double time){
        return distance / time;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int distanceInt = scanner.nextInt();
        int timeInt = scanner.nextInt();

        double distanceDouble = scanner.nextDouble();
        double timeDouble = scanner.nextDouble();

        int velocityInt = VelocityCalculator.calculateVelocity(distanceInt, timeInt);
        double velocityDouble =
VelocityCalculator.calculateVelocity(distanceDouble, timeDouble);

        System.out.println("Velocity with integer inputs: " + velocityInt + " m/s");
        System.out.printf("Velocity with double inputs: %.2f m/s", velocityDouble);

        scanner.close();
    }
}

```

## 2. Problem Statement

Ram is designing a program to calculate the Body Mass Index (BMI). Your task is to assist him by following the given specifications.

Create a base class BMIcalculator with a method calculateBMI() to compute BMI using the formula  $\text{weight} / (\text{height} * \text{height})$ .

Extend the class with a subclass CustomBMICalculator that overrides the method calculateBMI() to calculate BMI based on custom criteria, assigning categories such as "Underweight," "Normal Weight," "Overweight," or "Obese."

BMI < 18.5, category = "Underweight" BMI >= 18.5 & < 24.9, category = "Normal Weight" BMI >= 25 & < 29.9, category = "Overweight" else category = "Obese"

Implement user input for weight and height and display both the standard and custom BMI calculations.

### ***Input Format***

The first line of input consists of a double value, representing the weight in kgs.

The second line consists of a double value, representing the height in meters.

### ***Output Format***

The first line of output prints: "Standard BMI Calculation:"

The second line of output prints: "BMI: " followed by the calculated BMI value (to two decimal places).

The third line of output prints: "Custom BMI Calculation:"

The fourth line of output prints: "Category: " followed by the BMI category.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 69.7

2.6

Output: Standard BMI Calculation:

BMI: 10.31

Custom BMI Calculation:

Category: Underweight

### ***Answer***

```

import java.util.Scanner;

class BMlcalculator{
    protected double weight;
    protected double height;
    public BMlcalculator(double weight, double height){
        this.weight = weight;
        this.height = height;
    }
    public double calculateBMI(){
        return weight / (height * height);
    }
    public void displayBMI(){
        double bmi = calculateBMI();
        System.out.printf("BMI: %.2f\n", bmi);
    }
}

class CustomBMlcalculator extends BMlcalculator{
    public CustomBMlcalculator(double weight, double height){
        super(weight, height);
    }
    public double calculateBMI(){
        return super.calculateBMI();
    }
    public String getBMlCategory(){
        double bmi = calculateBMI();
        if (bmi < 18.5){
            return "Underweight";
        }
        else if (bmi >= 18.5 && bmi < 24.9){
            return "Normal Weight";
        }
        else if (bmi >= 25 && bmi < 29.9) {
            return "Overweight";
        }
        else{
            return "Obese";
        }
    }
    public void displayCustomBMI(){
        String category = getBMlCategory();
        System.out.println("Category: " + category);
    }
}

```

```

}
public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double weight = scanner.nextDouble();
        double height = scanner.nextDouble();

        BMlcalculator bmiCalculator = new BMlcalculator(weight, height);
        System.out.println("Standard BMI Calculation:");
        bmiCalculator.displayBMI();

        CustomBMlcalculator customBMlcalculator = new
        CustomBMlcalculator(weight, height);

### 3. Problem Statement

In a company, each manager has a unique employee ID and a monthly salary. You are required to design a program that will calculate and display the annual(12 months) salary of a manager based on the input details provided by the user.

Implement the solution using a single inheritance approach.

Employee: The base class with attributes name and employeeID.

Manager: The derived class inheriting from Employee, with an additional attribute salary.

#### **Input Format**

The first line of input consists of a string name, representing the manager's name.

The second line of input consists of an integer employeeID, representing the manager's employee ID.

The third line of input consists of a double salary, representing the manager's monthly salary.

### **Output Format**

The first line of output prints: Name: <name>

The second line of output prints: Annual Salary: Rs. <annual\_salary> (rounded to two decimal places).

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Davis

234

28750.75

Output: Name: Davis

Annual Salary: Rs. 345009.00

### **Answer**

```
import java.util.Scanner;
import java.text.DecimalFormat;

class Employee{
    String name;
    int employeeID;
    public Employee(String name, int employeeID){
        this.name = name;
        this.employeeID = employeeID;
    }
}

class Manager extends Employee{
    double salary;
    public Manager(String name, int employeeID, double salary){
        super(name, employeeID);
        this.salary = salary;
    }
}
```

```

    }
    public double calculateAnnualSalary(){
        return salary * 12;
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        DecimalFormat df = new DecimalFormat("0.00");

        String name = scanner.nextLine();
        int employeeID = scanner.nextInt();
        double salary = scanner.nextDouble();

        Manager manager = new Manager(name, employeeID, salary);

        System.out.println("Name: " + manager.name);
        System.out.println("Annual Salary: Rs. " +
df.format(manager.calculateAnnualSalary()));

        scanner.close();
    }
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

John is planning a long road trip and wants to calculate the distance his car can travel based on its speed and fuel capacity. As John knows that different cars have different fuel efficiencies, he wants a program that can help him estimate the travel distance for any given car.

To do this, you are tasked with creating a program that calculates the travel distance of a car based on its speed and fuel capacity. The calculation is simple and follows the formula:

Travel Distance = Speed \* Fuel Capacity

You need to model this system using a Vehicle class and a Car class. The Vehicle class will have attributes for the speed and fuel capacity, while the Car class will inherit from the Vehicle class and include a method to calculate the travel distance.

### ***Input Format***

The first line of input consists of a double value representing the speed of the car in km/h.

The second line of input consists of a double value representing the fuel capacity of the car in liters.

### ***Output Format***

The first line should print "Speed: X km/h", where X is the speed of the car, rounded to two decimal places.

The second line should print "Fuel Capacity: Y liters", where Y is the fuel capacity of the car, rounded to two decimal places.

The third line should print "Travel Distance: Z km", where Z is the total travel distance the car can cover, rounded to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 10.0

1.0

Output: Speed: 10.00 km/h

Fuel Capacity: 1.00 liters

Travel Distance: 10.00 km

### ***Answer***

```
import java.util.Scanner;
```

```
class Vehicle{  
    double speed;  
    double fuelCapacity;  
    public Vehicle(double speed, double fuelCapacity){
```

```

        this.speed = speed;
        this.fuelCapacity = fuelCapacity;
    }
}

class Car extends Vehicle{
    public Car(double speed, double fuelCapacity){
        super(speed, fuelCapacity);
    }
    public double calculateTravelDistance(){
        return speed * fuelCapacity;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double speed = scanner.nextDouble();
        double fuelCapacity = scanner.nextDouble();

        Car car = new Car(speed, fuelCapacity);

        System.out.println("Speed: " + String.format("%.2f", car.speed) + " km/h");
        System.out.println("Fuel Capacity: " + String.format("%.2f", car.fuelCapacity)
+ " liters");
        System.out.println("Travel Distance: " + String.format("%.2f",
car.calculateTravelDistance()) + " km");

        scanner.close();
    }
}

```

#### Section 1 : Coding

##### 1. Problem Statement

Teena is launching a new airline, Boeing747, and needs to calculate the total revenue generated from ticket sales based on the ticket cost and seat availability. Teena's airline offers two types of seats: regular and premium. The ticket cost and seat availability for both types of seats need to be considered for revenue calculation.

To help with this, Teena wants to implement a system using multilevel inheritance with three classes:

**Airline:** This class will have the ticket cost as an attribute and defines the method `setCost(double cost)` and `double getCost()`. **Indigo:** This class will extend **Airline** and add the seat availability attribute and defines the method `getSeatAvailability()` and `setSeatAvailability(int seatAvailability)`. **Boeing747:** This class will extend **Indigo** and include a

method `calculateTotalRevenue()` based on the ticket cost and seat availability .

Teena needs to calculate the total revenue using the formula:

$\text{Total Revenue} = \text{ticket cost} * \text{seat availability}$

Help Teena implement this system for calculating the revenue of her airline.

### ***Input Format***

The first line of input consists of a double value, representing the flight's ticket cost.

The second line consists of an integer, representing seat availability.

### ***Output Format***

The first line of output prints "Ticket Cost: Rs. " followed by a double value representing the ticket cost rounded to one decimal place.

The second line of output prints "Seat Availability: X seats" where X is an integer value representing the seat availability.

The third line of output prints "Total Revenue: Rs. " followed by a double value representing the total revenue rounded to one decimal place.

Refer to the sample output for the exact text and format.

### ***Sample Test Case***

Input: 1000.0  
100

Output: Ticket Cost: Rs. 1000.0  
Seat Availability: 100 seats  
Total Revenue: Rs. 100000.0

### ***Answer***

```
import java.util.Scanner;

class Airline{
    private double cost;
    public void setCost(double cost){
```

```

        this.cost = cost;
    }
    public double getCost(){
        return cost;
    }
}
class Indigo extends Airline{
    private int seatAvailability;
    public void setSeatAvailability(int seatAvailability){
        this.seatAvailability = seatAvailability;
    }
    public int getSeatAvailability(){
        return seatAvailability;
    }
}
class Boeing747 extends Indigo{
    public double calculateTotalRevenue(){
        return getCost() * getSeatAvailability();
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        Boeing747 plane = new Boeing747();

        double ticketCost = scanner.nextDouble();
        plane.setCost(ticketCost);
        int seatAvailability = scanner.nextInt();
        plane.setSeatAvailability(seatAvailability);

        System.out.printf("Ticket Cost: Rs. %.1f\n", plane.getCost());
        System.out.println("Seat Availability: " + plane.getSeatAvailability() + "
seats");
        System.out.printf("Total Revenue: Rs. %.1f\n",
plane.calculateTotalRevenue());
    }
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

A bank provides two types of deposit schemes: Fixed Deposits (FD) and Recurring Deposits (RD). Customers want to calculate the interest they can earn based on their selected scheme.

Develop a Java program using inheritance to compute the interest for FD and RD. The program should include:

A base class Account with attributes accountHolder and principalAmount, along with a method for interest calculation. A subclass FixedDeposit that calculates interest for FD. A subclass RecurringDeposit that calculates interest for RD.

Formulas Used:

Interest for FD:  $(\text{principal amount} * \text{duration in years} * \text{rate of interest}) / 100$

Interest for RD:  $(\text{maturity amount} * \text{duration in months} * \text{rate of interest}) / (12 * 100)$ , where maturity amount = monthly deposit \* duration in months.

### ***Input Format***

The first line of input consists of the choice (1 for FD, 2 for RD).

If the choice is 1, the following lines consist of account holder (string), principal amount (double), duration in years (int), and rate of interest (double).

If the choice is 2, the following lines consist of account holder (string), monthly deposit (int), duration in months (int), and rate of interest (double).

### ***Output Format***

The output prints the calculated interest with one decimal place in the following format.

For choice 1: "Interest for FD: <calculated interest >"

For choice 2: "Interest for FD: <calculated interest >"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1

Alice

50000.56

5

6.5

Output: Interest for FD: 16250.2

### **Answer**

```
import java.util.Scanner;
```

```
class Account{
```

```
    String accountHolder;
```

```
    double principalAmount;
```

```
    public Account(String accountHolder, double principalAmount){
```

```
        this.accountHolder = accountHolder;
```

```
        this.principalAmount = principalAmount;
```

```
    }
```

```
    public double calculateInterest(){
```

```
        return 0.0;
```

```
    }
```

```
}
```

```
class FixedDeposit extends Account{
```

```
    int durationInYears;
```

```
    double rateOfInterest;
```

```
    public FixedDeposit(String accountHolder, double principalAmount, int  
durationInYears, double rateOfInterest){
```

```
        super(accountHolder, principalAmount);
```

```
        this.durationInYears = durationInYears;
```

```
        this.rateOfInterest = rateOfInterest;
```

```
    }
```

```
    public double calculateInterest(){
```

```
        return (principalAmount * durationInYears * rateOfInterest) / 100.0;
```

```
    }
```

```
}
```

```
class RecurringDeposit extends Account{
```

```
    int monthlyDeposit;
```

```
    int durationInMonths;
```

```
    double rateOfInterest;
```

```
    public RecurringDeposit(String accountHolder, int monthlyDeposit, int
```

```

durationInMonths, double rateOfInterest){
    super(accountHolder, 0);
    this.monthlyDeposit = monthlyDeposit;
    this.durationInMonths = durationInMonths;
    this.rateOfInterest = rateOfInterest;
}
public double calculateInterest(){
    double maturityAmount = monthlyDeposit * durationInMonths;
    return (maturityAmount * durationInMonths * rateOfInterest) / (12 * 100.0);
}
}

```

```

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int choice = sc.nextInt();

        switch (choice) {
            case 1:
                sc.nextLine();
                String fdName = sc.nextLine();
                double fdPrincipal = sc.nextDouble();
                int fdDuration = sc.nextInt();
                double fdRate = sc.nextDouble();

                FixedDeposit fd = new FixedDeposit(fdName, fdPrincipal, fdDuration,
fdRate);
                System.out.printf("Interest for FD: %.1f", fd.calculateInterest());
                break;

            case 2:
                sc.nextLine();
                String rdName = sc.nextLine();
                int rdDeposit = sc.nextInt();
                int rdDuration = sc.nextInt();
                double rdRate = sc.nextDouble();

                RecurringDeposit rd = new RecurringDeposit(rdName, rdDeposit,
rdDuration, rdRate);
                System.out.printf("Interest for RD: %.1f", rd.calculateInterest());
                break;

```

```
        default:
            System.out.println("Invalid Choice");
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

A painter needs to determine the cost to paint different shapes based on their surface area. The program should be designed to handle the area of a sphere and calculate the total painting cost using the following formulas:

Area of sphere:  $\text{Area} = 4 * \pi * r^2$  where  $\pi = 3.14$   
Total painting cost:  $\text{Cost} = \text{cost per square meter} * \text{area of sphere}$

The program will consist of three classes:

Shape class: This class should set the shape type and radius.

Area class: This class should extend Shape to calculate the area.

Cost class: This class should extend Area to calculate the total painting cost.

#### **Input Format**

The input consists of a string representing the shape type, a double value representing the radius, and another double value representing the cost per square meter on each line.

#### **Output Format**

For a valid shape type of "Sphere":

- The first line prints: "Area of Sphere is: <calculated\_area>" rounded to two decimal places.
- The second line prints: "Cost to paint the shape is: <total\_painting\_cost>" rounded to two decimal places.

For any other shape types, print: "Invalid type".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Sphere

3.4

5.8

Output: Area of Sphere is: 145.19

Cost to paint the shape is: 842.12

### **Answer**

```
import java.util.Scanner;

class Shape{
    String shapeType;
    double radius;
    public void setShape(String shapeType, Scanner scanner){
        this.shapeType = shapeType;
        if (shapeType.equals("Sphere")){
            this.radius = scanner.nextDouble();
        }
    }
}

class Area extends Shape{
    double area;
    public void calculateArea(){
        if (shapeType.equals("Sphere")){
            double pi = 3.14;
            area = 4 * pi * radius * radius;
        }
    }
}

class Cost extends Area{
    double costPerSqMeter;
    double totalCost;
    public void setCost(double costPerSqMeter){
        this.costPerSqMeter = costPerSqMeter;
    }
    public void calculateCost(){
        if (shapeType.equals("Sphere")){
            totalCost = area * costPerSqMeter;
            System.out.printf("Area of Sphere is: %.2f\n", area);
            System.out.printf("Cost to paint the shape is: %.2f\n", totalCost);
        }
    }
}
```

```

    }
    else{
        System.out.println("Invalid type");
    }
}
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String s = scanner.next();
        Cost shape = new Cost();
        shape.setShape(s, scanner);
        double costToPaint = scanner.nextDouble();
        shape.calculateArea();
        shape.setCost(costToPaint);
        shape.calculateCost();
    }
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Teena's retail store has implemented a Loyalty Points System to reward customers based on their spending. The program calculates and displays the loyalty points based on whether the customer is a regular or a premium customer.

For regular customers (class Customer), the loyalty points are calculated as:

Loyalty points = amount spent / 10

For premium customers (class PremiumCustomer, which inherits from Customer), the loyalty points are calculated as:

Loyalty points = 2 \* (amount spent / 10)

The program should use method overriding for premium customers to calculate their loyalty points. The method that needs to be overridden is calculateLoyaltyPoints in the Customer class.

### ***Input Format***

The first line of input consists of an integer representing the amount spent by the customer.

The second line consists of a string representing the premium customer status:

- "yes" if the customer is a premium customer.
- "no" if the customer is not a premium customer.

### ***Output Format***

The output should display the loyalty points earned based on the amount spent and the customer type.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 50

yes

Output: 10

### ***Answer***

```
import java.util.Scanner;

class Customer {
    public int calculateLoyaltyPoints(int amountSpent){
        return amountSpent / 10;
    }
}

class PremiumCustomer extends Customer{
    public int calculateLoyaltyPoints(int amountSpent){
        return 2 * (amountSpent / 10);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int amountSpent = scanner.nextInt();
```

```
String isPremium = scanner.next().toLowerCase();
```

```
Customer customer;
```

```
if (isPremium.equals("yes")) {  
    customer = new PremiumCustomer();  
} else {  
    customer = new Customer();  
}
```

```
int loyaltyPoints = customer.calculateLoyaltyPoints(amountSpent);
```

```
System.out.println(loyaltyPoints);
```

### REC\_2028\_OOPS using Java\_Week 7\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 9

#### Section 1 : MCQ

1. What is the output of the following code?

```
interface A {  
    static void display() {  
        System.out.println("Static method in A");  
    }  
}  
  
class B implements A {  
    static void display() {  
        System.out.println("Static method in B");  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {
```

```
        B.display();  
    }  
}
```

**Answer**

Static method in B

**Status :** Correct

**Marks :** 1/1

2. Which of the following statements is true regarding default methods in Java interfaces?

**Answer**

A default method can be overridden in a class implementing the interface.

**Status :** Correct

**Marks :** 1/1

3. Consider a class implementing an interface and extending a class, both having a method with the same name. Which method gets called?

**Answer**

The method from the interface is called, but only if it is declared as static

**Status :** Wrong

**Marks :** 0/1

4. How do you call a static method from an interface MyInterface?

**Answer**

new MyInterface().staticMethod();

**Status :** Wrong

**Marks :** 0/1

5. Which of the following statements about Java interfaces is true?

**Answer**

A class can implement multiple interfaces.

**Status :** Correct

**Marks :** 1/1

6. What is the output of the following code?

```
interface A {  
    default void show() {  
        System.out.println("A's Default Method");  
    }  
}
```

```
class B {  
    public void show() {  
        System.out.println("B's Method");  
    }  
}
```

```
class C extends B implements A {  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.show();  
    }  
}
```

**Answer**

A's Default Method

**Status :** Wrong

**Marks :** 0/1

7. Can a Java interface contain both default and static methods?

**Answer**

Yes, an interface can have both default and static methods.

**Status :** Correct

**Marks :** 1/1

8. What happens when an implementing class does not override a default method from an interface?

**Answer**

The class must declare itself abstract.

**Status : Wrong**

**Marks : 0/1**

9. What is the primary purpose of static methods in Java interfaces?

**Answer**

They allow an interface to provide helper methods without requiring an implementing class.

**Status : Correct**

**Marks : 1/1**

10. What is the output of the following code?

```
interface A {  
    default void show() {  
        System.out.println("A's Default Method");  
    }  
}
```

```
interface B {  
    default void show() {  
        System.out.println("B's Default Method");  
    }  
}
```

```
class C implements A, B {  
    public void show() {  
        A.super.show();  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {
```

```
C obj = new C();
obj.show();
}
}
```

**Answer**

A's Default Method

**Status :** Correct

**Marks :** 1/1

11. What is the output of the following code?

```
interface X {
    default void show() {
        System.out.println("X's Default Method");
    }
}
```

```
interface Y {
    default void show() {
        System.out.println("Y's Default Method");
    }
}
```

```
class Z implements X, Y {
    public void show() {
        System.out.println("Z's Method");
    }
}
```

```
public class Main {
    public static void main(String[] args) {
        Z obj = new Z();
        obj.show();
    }
}
```

**Answer**

X's Default Method

**Status : Wrong**

**Marks : 0/1**

12. Which of the following is the correct way to declare an interface in Java?

**Answer**

```
public interface Vehicle { public void start() {};
```

**Status : Wrong**

**Marks : 0/1**

13. How can a class explicitly call a default method from an interface if there is a naming conflict?

**Answer**

Using InterfaceName.super.methodName();

**Status : Correct**

**Marks : 1/1**

14. What is the output of the following code?

```
interface MathOperations {  
    static int square(int x) {  
        return x * x;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        System.out.println(MathOperations.square(5));  
    }  
}
```

**Answer**

25

**Status : Correct**

**Marks : 1/1**

15. If a class implements two interfaces that have the same default method, what must the class do?

**Answer**

The class must override the method to resolve ambiguity.

**Status :** Correct

**Marks :** 1/1

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 7\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement:

Rajiv is analyzing the energy consumption in his household and wants to calculate the total cost based on the daily energy usage. He is given the rate per unit of electricity and the energy consumed for multiple days. To structure this calculation efficiently, he decides to use an interface-based approach.

Implement an interface CostCalculator with the necessary methods to retrieve energy details and compute the cost. The calculations should be handled in the EnergyConsumptionTracker class, while the EnergyConsumptionApp class should only handle input and output.

##### Formula

Energy Cost for one day = Energy Consumed per day \* Rate Per Unit

### ***Input Format***

The first line of input consists of the rate per unit as an 'R' (a double value).

The second line of input consists of the number of days 'N' (an integer).

The third line of input consists of the daily energy consumption values for each day 'D' (double values), separated by space.

### ***Output Format***

The first line of the output prints: "Day-wise Energy Cost:"

The next N lines of the output print the day-wise energy costs(double type) and the total energy cost (double type) in Indian Rupees in the following format: "Day [day\_number]: Rs. [energy\_cost]"

The last line of the output prints: "Total Energy Cost: Rs. [total\_cost]"

Note: energy\_cost and total\_cost are rounded off to two decimal points

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 0.01

3

10.0 20.0 30.0

Output: Day-wise Energy Cost:

Day 1: Rs. 0.10

Day 2: Rs. 0.20

Day 3: Rs. 0.30

Total Energy Cost: Rs. 0.60

### ***Answer***

```
import java.util.Scanner;
```

```
interface CostCalculator{
```

```

    void getEnergyDetails(Scanner scanner);
    void calculateAndDisplayCost();
}

class EnergyConsumptionTracker implements CostCalculator{

##### 1. Problem Statement

Jaheer is working on a health monitoring system to help individuals calculate their Body Mass Index (BMI). He has implemented a basic BMI calculator and an interface called HealthCalculator. It should have a method called calculateBMI.

You are tasked with creating a program that takes weight and height as input, calculates the BMI using the BMI Calculator class, and displays the result. If the height or weight is less than or equal to zero, then return -1.

Formula:  $BMI = \text{weight} / (\text{height} * \text{height})$

##### ***Input Format***

The first line of input consists of a double value W, the person's weight in kilograms.

The second line consists of a double value H, the height of the person in meters.

### **Output Format**

The output displays "BMI: " followed by a double value, representing the calculated BMI, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 70.0

1.75

Output: BMI: 22.86

### **Answer**

```
import java.util.Scanner;

interface HealthCalculator{
    double calculateBMI(double weight, double height);
}

class BMICalculator implements HealthCalculator{
    public double calculateBMI(double weight, double height){
        if (weight<=0 || height<=0){
            return -1;
        }
        return weight/(height * height);
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double weight = scanner.nextDouble();
        double height = scanner.nextDouble();

        BMICalculator bmiCalculator = new BMICalculator();
        double bmi = bmiCalculator.calculateBMI(weight, height);
```

```
System.out.printf("BMI: %.2f\n", bmi);  
    scanner.close();  
}  
}
```

##### 1. Problem Statement

A financial analyst, Alex, needs a program to calculate simple interest for various financial transactions. He requires a straightforward tool that takes in the principal amount, interest rate, and time in years and computes the interest.

The formula to be used is:  $\text{Interest} = \text{Principal} \times \text{Rate} \times \text{Time} / 100$

Implement this functionality using the InterestCalculator interface and the SimpleInterestCalculator class.

##### **Input Format**

The first line of input consists of the principal amount P as a double value.

The second line of input consists of the annual interest rate  $r$  as a double value.

The third line of input consists of the number of years  $t$  as a positive integer, which is an integer value.

### **Output Format**

The output displays the calculated simple interest in the following format: "Simple Interest: [interest\_value]", Here, [interest\_value] should be replaced with the actual interest value calculated by the program.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 1000.00

5.00

2

Output: Simple Interest: 100.0

### **Answer**

```
import java.util.Scanner;

interface InterestCalculator{
    double simpleInterest(double principal, double rate, int time);
}

class SimpleInterestCalculator implements InterestCalculator{
    public double simpleInterest(double principal, double rate, int time){
        return (principal*rate*time)/100;
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double principal = scanner.nextDouble();

        double rate = scanner.nextDouble();

        int time = scanner.nextInt();
```

```
InterestCalculator calculator = new SimpleInterestCalculator();  
double interest = calculator.simpleInterest(principal, rate, time);  
System.out.println("Simple Interest: " + interest);  
}  
}
```

#### Section 1 : Coding

##### 1. Problem Statement

Maria, a software developer, is working on an inventory management system project using Java that utilizes an inventory interface to manage a store's products.

The interface should define two methods: `addProduct`, which adds a product by accepting its name, price, and quantity, and `calculateTotalValue`, which computes the total value of all products in the inventory. Implement the interface in a class called `SimpleInventory`, which internally manages a list of `Product` objects.

Each `Product` object should encapsulate the product's name, price, and quantity and include a method to calculate its value as  $\text{price} \times \text{quantity}$ . The system should allow users to dynamically add products to the inventory and calculate the total value of all products stored.

Help Maria achieve the task.

### ***Input Format***

The first line of input consists of an integer to choose one of the following options:

- 1 - to add a product to the inventory.
- 2 - to calculate and view the total inventory value.
- 3 - to exit the program.

For Choice 1 (Add Product):

The next input line is the string representing the product name as a string (single or multi-word, without quotes).

The next line is a double value representing the price as a decimal value

The next line is an integer value representing the quantity as an integer

For Choices 2 and 3, no additional input is required

### ***Output Format***

The output displays the results of the commands as follows:

- For the addProduct command, the program should display "Product added to inventory."
- For choice 2, the program should display "Total inventory value [totalvalue].  
"The total value should be displayed with one decimal place. If there is no product in the inventory, print the total as 0.0.
- For choice 3, the program should exit

If the choice is not 1, 2, or 3, then print "Invalid choice. Please select a valid option (1/2/3).".

Refer to the sample output for the formatting specifications.

### Sample Test Case

Input: 1

Laptop

800.0

3

2

5

3

Output: Product added to inventory.

Total inventory value: \$2400.0

Invalid choice. Please select a valid option (1/2/3).

### Answer

```
import java.util.Scanner;
```

```
interface Inventory{
```

```
    void addProduct(String name, double price, int quantity);
```

```
    double calculateTotalValue();
```

```
}
```

```
class SimpleInventory implements Inventory{
```

```
    private double totalValue = 0.0;
```

```
    public SimpleInventory(int capacity){
```

```
    }
```

```
    public SimpleInventory(){
```

```
    }
```

```
    public void addProduct(String name, double price, int quantity){
```

```
        totalValue += price * quantity;
```

```
        System.out.println("Product added to inventory.");
```

```
    }
```

```
    public double calculateTotalValue(){
```

```
        return totalValue;
```

```
    }
```

```
}
```

```
public class Main {
```

```
    public static void main(String[] args) {
```

```
        Scanner scanner = new Scanner(System.in);
```

```
        Inventory inventory = new SimpleInventory(10);
```

```
        while (true) {
```

```
            int choice = scanner.nextInt();
```

```
            if (choice == 1) {
```

```
scanner.nextLine();
String productName = scanner.nextLine();
double price = scanner.nextDouble();
int quantity = scanner.nextInt();
inventory.addProduct(productName, price, quantity);
} else if (choice == 2) {
    double totalValue = inventory.calculateTotalValue();
    System.out.println("Total inventory value: $" + totalValue);
} else if (choice == 3) {
    break;
} else {
    System.out.println("Invalid choice. Please select a valid option
(1/2/3).");
}
}
scanner.close();
}
```

##### 1. Problem Statement

Raj is curious about how old he is in the current year.

He has asked you to create a simple program that calculates a person's age based on their birth year. You decide to implement this functionality using the AgeCalculator interface and the HumanAgeCalculator class.

Note: The current year is 2024. Calculate the current age by using the formula: current year - birth year.

##### ***Input Format***

The input consists of an integer representing the birth year.

##### ***Output Format***

The output displays "You are X years old." where X is an integer representing the calculated age based on the entered birth year.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 1934

Output: You are 90 years old.

### **Answer**

```
import java.util.Scanner;

interface AgeCalculator{
    int calculateAge(int birthYear);
}

class HumanAgeCalculator implements AgeCalculator{
    private static final int CURRENT_YEAR = 2024;
    public int calculateAge(int birthYear){
        return CURRENT_YEAR - birthYear;
    }
}

class AgeCalculatorApp {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        AgeCalculator ageCalculator = new HumanAgeCalculator();

        int birthYear = scanner.nextInt();
        int age = ageCalculator.calculateAge(birthYear);

        System.out.println("You are " + age + " years old.");
    }
}

##### 1. Problem Statement

Oviya is fascinated by automorphic numbers and wants to create a program to determine whether a given number is an automorphic number or not.

An automorphic number is a number whose square ends with the same digits as the number itself. For example,  $25 = (25)^2 = 625$

Oviya has defined two interfaces: NumberInput for taking user input and AutomorphicChecker for checking if a given number is automorphic. The class AutomorphicNumber implements both interfaces.

Help her complete the task.

***Input Format***

The input consists of a single integer n.

### **Output Format**

If the input number is an automorphic number, print "n is an automorphic number". Otherwise, print "n is not an automorphic number".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 25

Output: 25 is an automorphic number

### **Answer**

```
import java.util.Scanner;

interface NumberInput{
    int getInput();
}

interface AutomorphicChecker{
    boolean checkAutomorphic(int n);
}

class AutomorphicNumber implements NumberInput, AutomorphicChecker{
    private Scanner scanner = new Scanner(System.in);
    public int getInput(){
        return scanner.nextInt();
    }
    public boolean checkAutomorphic(int n){
        int square = n * n;
        int tempN = n;
        while (tempN > 0){
            if (tempN % 10 != square % 10){
                return false;
            }
            tempN /= 10;
            square /= 10;
        }
        return true;
    }
}
```

```

public class Main {
    public static void main(String[] args) {
        AutomorphicNumber automorphicNumber = new AutomorphicNumber();
        int inputNumber = automorphicNumber.getInput();

        boolean isAutomorphic =
        automorphicNumber.checkAutomorphic(inputNumber);

        if (isAutomorphic) {
            System.out.println(inputNumber+" is an automorphic number");
        } else {
            System.out.println(inputNumber+" is not an automorphic number");
        }
    }
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement:

Alice has been tasked with implementing a simple calculator interface and a corresponding class for performing basic addition and subtraction operations. The task is to create an interface called Calculator with two methods: add and subtract. The add method should take two numbers as input and return their sum, while the subtract method should take two numbers as input and return their difference.

Implement a class called SimpleCalculator that implements the Calculator interface. This class should provide the functionality for adding and subtracting numbers. Write a code that satisfies the above requirements.

### **Input Format**

The first line of input consists of a single integer, representing the choice

If the choice is 1 or 2, the next two lines consist of 2 double values, representing the numbers to do addition or subtraction.

### **Output Format**

The output prints a float-value with one decimal value representing the sum of

two number or difference of two number.

Refer to the sample output for format specification.

### **Sample Test Case**

Input: 1

5.5

3.5

Output: Result: 9.0

### **Answer**

```
import java.util.Scanner;
```

```
// You are using Java
```

```
interface Calculator{
```

```
    double add(double a, double b);
```

```
    double subtract(double a, double b);
```

```
}
```

```
class SimpleCalculator implements Calculator{
```

```
    public double add(double a, double b){
```

```
        return a + b;
```

```
    }
```

```
    public double subtract(double a, double b){
```

```
        return a - b;
```

```
    }
```

```
}
```

```
class MathOperationsProgram {
```

```
    public static void main(String[] args) {
```

```
        Scanner scanner = new Scanner(System.in);
```

```
        SimpleCalculator calculator = new SimpleCalculator();
```

```
        int choice = scanner.nextInt();
```

```
        if (choice == 1) {
```

```
            double num1 = scanner.nextDouble();
```

```
            double num2 = scanner.nextDouble();
```

```
            double result = calculator.add(num1, num2);
```

```

        System.out.println("Result: " + result);
    } else if (choice == 2) {
        double num1 = scanner.nextDouble();
        double num2 = scanner.nextDouble();
        double result = calculator.subtract(num1, num2);
        System.out.println("Result: " + result);
    } else {
        System.out.println("Invalid choice. Please choose 1 for addition or 2 for subtraction.");
    }

    scanner.close();
}
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Develop a program for managing employee information that caters to both full-time and part-time employees. The program should be capable of computing the salary for each category of employee and presenting their particulars. To achieve this, create two classes, FullTimeEmployee and PartTimeEmployee, that adhere to the Employee interface.

The program is expected to accept input data, including the name and monthly salary for full-time employees, as well as the name, hourly rate, and hours worked for part-time employees. Subsequently, it should calculate and exhibit the employee details and their respective salaries.

For Full-Time employees, the annual salary should be calculated as 12 times the monthly salary.

For Part-Time employees, the salary calculation should be based on the formula: hourly rate \* hours worked.

#### **Input Format**

The first line of input should be a string representing the name of a full-time employee.

The second line of input should be an integer representing the monthly salary of the full-time employee.

The third line of input should be a string representing the name of a part-time employee.

The fourth line of input should be an integer representing the hourly rate of the part-time employee.

The fifth line of input should be an integer representing the number of hours worked by the part-time employee.

### ***Output Format***

The output displays the following details:

Full-Time Employee Details:

Name: [Full-Time Employee Name] (string)

Monthly Salary: \$[Monthly Salary] (integer)

Annual Salary: \$[12 times Monthly Salary] (integer)

Part-Time Employee Details:

Name: [Part-Time Employee Name] (string)

Hourly Rate: \$[Hourly Rate] (integer)

Hours Worked: [Hours Worked] hours (integer)

Monthly Salary: \$[Calculated Monthly Salary] (integer)

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: John Smith

15000

Mary Johnson

100

100

Output: Full-Time Employee Details:

Name: John Smith

Monthly Salary: \$15000

Annual Salary: \$180000

Part-Time Employee Details:

Name: Mary Johnson

Hourly Rate: \$100

Hours Worked: 100 hours

Monthly Salary: \$10000

### **Answer**

```
import java.util.Scanner;
```

```
interface Employee{  
    void displayDetails();  
}
```

```
class FullTimeEmployee implements Employee{  
    private String name;  
    private int monthlySalary;  
    public FullTimeEmployee(String name, int monthlySalary){  
        this.name = name;  
        this.monthlySalary = monthlySalary;  
    }  
    public int getAnnualSalary(){  
        return monthlySalary * 12;  
    }  
    public void displayDetails(){  
        System.out.println("Full-Time Employee Details:");  
        System.out.println("Name: " + name);  
        System.out.println("Monthly Salary: $" + monthlySalary);  
        System.out.println("Annual Salary: $" + getAnnualSalary());  
    }  
}
```

```

}
class PartTimeEmployee implements Employee{
    private String name;
    private int hourlyRate;
    private int hoursWorked;
    public PartTimeEmployee(String name, int hourlyRate, int hoursWorked){
        this.name = name;
        this.hourlyRate = hourlyRate;
        this.hoursWorked = hoursWorked;
    }
    public int getMonthlySalary(){
        return hourlyRate * hoursWorked;
    }
    public void displayDetails(){
        System.out.println("Part-Time Employee Details:");
        System.out.println("Name: " + name);
        System.out.println("Hourly Rate: $" + hourlyRate);
        System.out.println("Hours Worked: " + hoursWorked + " hours");
        System.out.println("Monthly Salary: $" + getMonthlySalary());
    }
}

```

```

class EmployeeInheritanceDemo {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String fullName = scanner.nextLine();
        int fullTimeSalary = scanner.nextInt();
        scanner.nextLine();
        String partTimeName = scanner.nextLine();
        int hourlyRate = scanner.nextInt();
        int hoursWorked = scanner.nextInt();
        FullTimeEmployee fullTimeEmployee = new FullTimeEmployee(fullName,
fullTimeSalary);
        PartTimeEmployee partTimeEmployee = new
PartTimeEmployee(partTimeName, hourlyRate, hoursWorked);
        fullTimeEmployee.displayDetails();
        System.out.println();
        partTimeEmployee.displayDetails();
        scanner.close();
    }
}

```

**Marks :** 10/10

#### 4. Problem Statement

Sophia is developing a matrix analysis tool for a data analytics company. The tool needs to analyze square matrices and extract insights from the matrix diagonals.

To organize the code properly, Sophia creates an interface named `Matrix` that declares a method for finding the smallest and largest elements along the principal and secondary diagonals of the matrix.

Sophia then creates a class named `MatrixAnalyzer` that implements the `Matrix` interface. This class provides the logic to process a given square matrix and print:

The smallest and largest elements in the principal diagonal (from top-left to bottom-right). The smallest and largest elements in the secondary diagonal (from top-right to bottom-left).

Your task is to implement the `Matrix` interface and the `MatrixAnalyzer` class. The main driver program (in the class `Main`) will read the input matrix, create an instance of `MatrixAnalyzer`, and invoke its method to display the results.

##### ***Input Format***

The first line contains an integer  $n$ , representing the size of the square matrix.

The next  $n$  lines each contain  $n$  integers separated by spaces, representing the elements of the matrix.

##### ***Output Format***

The output prints the four lines:

"Smallest Element - 1: <smallest element in the principal diagonal>" (integer)

"Largest Element - 1: <largest element in the principal diagonal>" (integer)

"Smallest Element - 2: <smallest element in the secondary diagonal>" (integer)

"Largest Element - 2: <largest element in the secondary diagonal>" (integer)

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 5

7 8 9 0 1

2 3 4 5 6

5 4 2 0 8

23 5 6 8 9

12 5 6 7 32

Output: Smallest Element - 1: 2

Largest Element - 1: 32

Smallest Element - 2: 1

Largest Element - 2: 12

### **Answer**

```
import java.util.Scanner;
```

```
interface Matrix{
```

```
    void diagonalsMinMax(int[][] matrix);
```

```
}
```

```
class MatrixAnalyzer implements Matrix{
```

```
    public void diagonalsMinMax(int[][] matrix){
```

```
        int n = matrix.length;
```

```
        int minPrincipal = matrix[0][0];
```

```
        int maxPrincipal = matrix[0][0];
```

```
        int minSecondary = matrix[0][n - 1];
```

```
        int maxSecondary = matrix[0][n - 1];
```

```
        for (int i = 0; i < n; i++){
```

```
            int principalElem = matrix[i][i];
```

```
            if (principalElem < minPrincipal) minPrincipal = principalElem;
```

```
            if (principalElem > maxPrincipal) maxPrincipal = principalElem;
```

```
            int secondaryElem = matrix[i][n - 1 - i];
```

```
            if (secondaryElem < minSecondary) minSecondary = secondaryElem;
```

```
            if (secondaryElem > maxSecondary) maxSecondary = secondaryElem;
```

```
        }
```

```
        System.out.println("Smallest Element - 1: " + minPrincipal);
```

```
        System.out.println("Largest Element - 1: " + maxPrincipal);
```

```
        System.out.println("Smallest Element - 2: " + minSecondary);
```

```
        System.out.println("Largest Element - 2: " + maxSecondary);
```

```
}  
}  
}  
public class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int n = sc.nextInt();  
        int[][] matrix = new int[n][n];  
        for (int i = 0; i < n; i++) {  
            for (int j = 0; j < n; j++) {  
                matrix[i][j] = sc.nextInt();  
            }  
        }  
        MatrixAnalyzer analyzer = new MatrixAnalyzer();  
        analyzer.diagonalsMinMax(matrix);  
    }  
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 7\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### **Section 1 : Coding**

##### **1. Problem Statement:**

Ray is developing a tax calculation program in Java. The program includes an interface named TaxCalculator with a method to calculate tax based on salary. The SimpleTaxCalculator class implements this interface and determines the tax to be paid based on the salary amount using progressive tax slabs.

Your task is to implement this system. The program first takes an integer T representing the number of test cases, followed by T salary values. For each salary, calculate the total tax to be paid based on the following progressive tax rules:

For the first 50,000 of salary, the tax rate is 5%. For the next 50,000 (i.e., from 50,001 to 1,00,000), the tax rate is 10%. For any amount above 1,00,000, the tax rate is 20%. (That is, only the amount above 1,00,000 is

taxed at 20%.)

### Example

Input

3

78000

110000

23000

Output

5300

9500

1150

### Explanation

For Salary Rs. 78,000

$$\text{Tax} = 0.1 * (78,000 - 50,000) + 0.05 * 50,000 = 5,300$$

For Salary Rs. 1,10,000

$$\text{Tax} = 0.2 * (110000 - 100000) + 0.1 * 50,000 + 0.05 * 50,000 = 9,500$$

For Salary Rs. 23,000

$$\text{Tax} = 0.05 * 23,000 = 1,150$$

### ***Input Format***

The first line of the input consists of an integer, T, representing the number of test cases.

The next T lines of the input consist of a single integer, representing the annual salary of an individual, separated by a line.

### ***Output Format***

The output displays the calculated tax as an integer for each test case, separated by a line.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 2

100

300

Output: 5

15

### **Answer**

```
import java.util.Scanner;
```

```
interface TaxCalculator{  
    int calculateTax(int salary);  
}
```

```
class SimpleTaxCalculator implements TaxCalculator{  
    public int calculateTax(int salary){  
        int tax = 0;  
        if (salary <= 50000){  
            tax = (int)(salary * 0.05);  
        }  
        else if (salary <= 100000){  
            tax = (int)((50000 * 0.05) + ((salary - 50000) * 0.10));  
        }  
        else{  
            tax = (int)((50000 * 0.05) + (50000 * 0.10) + ((salary - 100000) * 0.20));  
        }  
        return tax;  
    }  
}
```

```
class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        int T = scanner.nextInt();  
  
        TaxCalculator taxCalculator = new SimpleTaxCalculator();  
  
        for (int i = 0; i < T; i++) {
```

```
int salary = scanner.nextInt();
int tax = taxCalculator.calculateTax(salary);
System.out.println(tax);
}

scanner.close();
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Maria, an online store owner, is looking to implement a pricing system that calculates the final price of products after applying discounts. She needs a program that takes the original price of a product and the discount percentage as input and computes the final discounted price. The discount is applied as a percentage of the original price. Maria wants to ensure that the final price is formatted to display exactly two decimal places.

Implement this functionality using the PriceCalculator interface and the DiscountCalculator class.

### **Input Format**

The first line of input consists of the original price (a double value).

The second line of input consists of a discount percentage (a double value).

### **Output Format**

The output displays the final price after the discount, adhering to the following format: "Final Price after discount: \$[final\_price]".

Here, [final\_price] should be replaced with the calculated final price, formatted as a currency value with two decimal places.

Refer to the sample output for the formatting specifications.

### Sample Test Case

Input: 100.0

10.0

Output: Final Price after discount: \$90.00

### Answer

```
import java.util.Scanner;

interface PriceCalculator{
    double calculatePrice(double originalPrice, double discountPercentage);
}

class DiscountCalculator implements PriceCalculator{
    public double calculatePrice(double originalPrice, double discountPercentage)
    {
        double discountAmount = (originalPrice * discountPercentage) / 100.0;
        double finalPrice = originalPrice - discountAmount;
        return finalPrice;
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        double originalPrice = scanner.nextDouble();
        double discount = scanner.nextDouble();
        PriceCalculator calculator = new DiscountCalculator();
        double finalPrice = calculator.calculatePrice(originalPrice, discount);
        System.out.printf("Final Price after discount: $%.2f%n", finalPrice); //
        Formats output to 2 decimal places
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement:

Rathish is planning a road trip and needs a program to convert speeds between miles per hour (MPH) and kilometers per hour (KPH).

Create an interface, SpeedConverter, with a method convertSpeed(double mph). Implement the interface with MPHtoKPHConverter class, allowing

Rathish to input MPH and receive the converted speed in KPH, rounded to two decimal points.

Formula: Speed in KPH = 1.60934 \* Speed in MPH.

### ***Input Format***

The input consists of a single double-point number representing the speed in miles per hour (MPH).

### ***Output Format***

The output displays the converted speed (double-point number) in kilometers per hour (KPH) rounded off to two decimal points in the following format:

"Speed in KPH: <<converted speed>>".

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 1.0

Output: Speed in KPH: 1.61

### ***Answer***

```
import java.util.Scanner;

interface SpeedConverter{
    double convertSpeed(double mph);
}

class MPHtoKPHConverter implements SpeedConverter{
    public double convertSpeed(double mph){
        double kph = mph * 1.60934;
        return kph;
    }
}

class SpeedConversionApp {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double speedInMPH = scanner.nextDouble();
```

```
SpeedConverter converter = new MPHtoKPHConverter();  
  
double speedInKPH = converter.convertSpeed(speedInMPH);  
  
System.out.printf("Speed in KPH: %.2f\n", speedInKPH);  
  
scanner.close();  
}  
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

John is developing a car loan calculator and has structured his program using two interfaces, Principal and InterestRate, defining methods for principal and interest rate retrieval.

The Loan class implements these interfaces, taking principal and annual interest rates as parameters. User input is solicited for these values, and the program ensures their validity before performing calculations. If input values are invalid (less than or equal to zero), an error message is displayed.

Note: Total interest = principal \* interest rate \* years

#### **Input Format**

The first line of input consists of a double value P, representing the principal.

The second line consists of a double value R, representing the annual interest rate.

The third line consists of an integer value N, representing the loan duration in years.

#### **Output Format**

If the input values are valid, print "Total interest paid: Rs. " followed by a double value, representing the total interest paid, rounded off to two decimal places.

If the input values are invalid (negative or zero values for principal, annual interest rate, or loan duration), print "Invalid input values!".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 20000.00

0.05

5

Output: Total interest paid: Rs.5000.00

### **Answer**

```
import java.util.Scanner;

interface Principal{
    double getPrincipal();
}
interface InterestRate{
    double getInterestRate();
}
class Loan implements Principal, InterestRate{
    private double principal;
    private double annualInterestRate;
    public Loan(double principal, double annualInterestRate){
        this.principal = principal;
        this.annualInterestRate = annualInterestRate;
    }
    public double getPrincipal(){
        return principal;
    }
    public double getInterestRate(){
        return annualInterestRate;
    }
    public double calculateTotalInterest(int years){
        return principal * annualInterestRate * years;
    }
}

public class Main {
```

```
public static void main(String[] args) {  
    Scanner scanner = new Scanner(System.in);  
  
    double carPrice = scanner.nextDouble();  
  
    double annualInterestRate = scanner.nextDouble();  
  
    int loanDuration = scanner.nextInt();  
  
    if (carPrice <= 0 || annualInterestRate <= 0 || loanDuration <= 0) {  
        System.out.println("Invalid input values!");  
        return;  
    }  
    Loan carLoan = new Loan(carPrice, annualInterestRate);  
    double totalInterest = carLoan.calculateTotalInterest(loanDuration);  
  
    System.out.printf("Total interest paid: Rs.%.2f%n", totalInterest);  
}  
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 8\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. What will be the output for the following code?

```
class InvalidVotingAgeException extends Exception {  
    public InvalidVotingAgeException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        try {  
            int age = 15;  
            if (age < 18) {  
                throw new InvalidVotingAgeException("You are not eligible to  
vote");  
            }  
        }  
    }  
}
```

```
        System.out.println("Eligible to vote");
    } catch (InvalidVotingAgeException e) {
        System.out.println(e.getMessage());
    }
}
}
```

**Answer**

You are not eligible to vote

**Status :** Correct

**Marks :** 1/1

2. What will be the output for the following code?

```
import java.io.*;

class NegativeAgeException extends Exception {
    public NegativeAgeException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            int age = -5;
            if (age < 0) {
                throw new NegativeAgeException("Age cannot be negative");
            }
        } catch (NegativeAgeException e) {
            System.out.println(e.getMessage());
        }
    }
}
```

**Answer**

Age cannot be negative

**Status :** Correct

**Marks :** 1/1

3. What is the purpose of a custom exception in Java?

**Answer**

To create user-defined exceptions for specific scenarios

**Status :** Correct

**Marks :** 1/1

4. what is the output of the following code?

```
class MyException extends Exception {  
    public MyException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    static void check() throws MyException {  
        throw new MyException("Custom Exception Occurred");  
    }  
  
    public static void main(String[] args) {  
        try {  
            check();  
        } catch (Exception e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

**Answer**

Custom Exception Occurred

**Status :** Correct

**Marks :** 1/1

5. What will be the output for the following code?

```
class InvalidUsernameException extends Exception {  
    public InvalidUsernameException(String message) {
```

```
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            String username = "abc";
            if (username.length() < 5) {
                throw new InvalidUsernameException("Username must be at
least 5 characters long");
            }
        } catch (InvalidUsernameException e) {
            System.out.println(e.getMessage());
        }
    }
}
```

**Answer**

Username must be at least 5 characters long

**Status :** Correct

**Marks :** 1/1

6. Which of the following is true about custom exceptions?

**Answer**

Custom exceptions must extend either Exception or RuntimeException

**Status :** Correct

**Marks :** 1/1

7. What will be the output for the following code?

```
import java.io.*;

class UnderageException extends Exception {
    public UnderageException(String message) {
        super(message);
    }
}
```

```

    }
    class Test {
        public static void main(String[] args) {
            try {
                int age = 17;
                if (age < 18) {
                    throw new UnderageException("Underage, cannot proceed");
                }
            } catch (UnderageException e) {
                System.out.println(e.getMessage());
            }
        }
    }
}

```

**Answer**

Underage, cannot proceed

**Status :** Correct

**Marks :** 1/1

8. What will be the output for the following code?

```

class NegativeBalanceException extends Exception {
    public NegativeBalanceException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            double balance = -500;
            if (balance < 0) {
                throw new NegativeBalanceException("Balance cannot be
negative");
            }
        } catch (NegativeBalanceException e) {
            System.out.println("Error: " + e.getMessage());
        }
    }
}

```

**Answer**

Error: Balance cannot be negative

**Status :** Correct

**Marks :** 1/1

9. How do you create an unchecked custom exception?

**Answer**

By extending RuntimeException

**Status :** Correct

**Marks :** 1/1

10. What will be the output for the following code?

```
import java.io.*;
```

```
class TemperatureTooHighException extends Exception {  
    public TemperatureTooHighException(String message) {  
        super(message);  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        try {  
            int temperature = 110;  
            if (temperature > 100) {  
                throw new TemperatureTooHighException("Temperature too  
high");  
            }  
        } catch (TemperatureTooHighException e) {  
            System.out.println(e.getMessage());  
        }  
    }  
}
```

**Answer**

Temperature too high

**Status :** Correct

**Marks :** 1/1

11. what is the output of the following code?

```
class MyException extends Exception {  
    public MyException(String message) {  
        super(message);  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        try {  
            throw new MyException("Error occurred");  
        } catch (MyException e) {  
            System.out.println(e);  
        }  
    }  
}
```

**Answer**

MyException: Error occurred

**Status :** Correct

**Marks :** 1/1

12. Which keyword is used to explicitly throw a custom exception?

**Answer**

throw

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
class MyException extends Exception {
```

```

    public MyException() {
        super("Default Exception Message");
    }
}

class Test {
    public static void main(String[] args) {
        try {
            throw new MyException();
        } catch (MyException e) {
            System.out.println(e.getMessage());
        }
    }
}

```

**Answer**

Default Exception Message

**Status :** Correct

**Marks :** 1/1

14. What will be the output for the following code?

```

import java.io.*;

class OutOfStockException extends Exception {
    public OutOfStockException(String message) {
        super(message);
    }
}

class Test {
    public static void main(String[] args) {
        try {
            int stock = 0;
            if (stock == 0) {
                throw new OutOfStockException("Item is out of stock");
            }
        } catch (OutOfStockException e) {
            System.out.println(e.getMessage());
        }
    }
}

```

```
}  
}  
}
```

**Answer**

Item is out of stock

**Status :** Correct

**Marks :** 1/1

15. What will happen if a checked custom exception is thrown inside a method without being caught or declared?

**Answer**

Compilation Error

**Status :** Correct

**Marks :** 1/1

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException  
AtTheRateException  
DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

### ***Input Format***

The first line of input contains the email to be validated.

### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

```
import java.util.Scanner;
class DotException extends Exception{
    public DotException(String message){
        super(message);
    }
}
class AtTheRateException extends Exception{
    public AtTheRateException(String message){
        super(message);
    }
}
class DomainException extends Exception{
    public DomainException(String message){
        super(message);
    }
}
public class Main{
    public static void validateEmail(String email) throws DotException,
    AtTheRateException, DomainException{
        int atCount = email.length() - email.replace("@", "").length();
        if (atCount != 1){
            throw new AtTheRateException("Invalid @ usage");
        }
        int lastDotIndex = email.lastIndexOf(".");
        int atIndex = email.indexOf("@");
        if (lastDotIndex < atIndex || lastDotIndex == email.length() - 1){
            throw new DotException("Invalid Dot usage");
        }
        String domain = email.substring(lastDotIndex + 1).toLowerCase();
        if (!(domain.equals("in") || domain.equals("com") || domain.equals("net") ||
        domain.equals("biz"))){
            throw new DomainException("Invalid Domain");
        }
    }
}
```

```
}  
}  
public static void main(String[] args){  
    Scanner scanner = new Scanner(System.in);  
    String email = scanner.nextLine();  
    try{  
        validateEmail(email);  
        System.out.println("Valid email address");  
    }  
    catch (DotException e){  
        System.out.println("DotException: " + e.getMessage());  
        System.out.println("Invalid email address");  
    }  
    catch (AtTheRateException e){  
        System.out.println("AtTheRateException: " + e.getMessage());  
        System.out.println("Invalid email address");  
    }  
    catch (DomainException e){  
        System.out.println("DomainException: " + e.getMessage());  
        System.out.println("Invalid email address");  
    }  
}  
}
```

##### 1. Problem Statement

Elsa, a busy professional, is using a scheduling application to plan her meetings efficiently. The application requires users to input meeting durations in minutes, ensuring that the duration is a positive integer and does not exceed 240 minutes (4 hours). Elsa needs a program to assist her in scheduling meetings securely with proper exception handling.

Create a Java class named `ElsaMeetingScheduler`. Implement a custom exception: `InvalidDurationException` for invalid meeting duration entries. Implement the main method to interactively take user input for a meeting duration. Implement the `validateMeetingDuration` method to validate the meeting duration based on the specified rules and throw a custom exception if the validation fails. Print appropriate success or error messages based on the meeting duration.

Implement a custom exception, `InvalidDurationException`, to handle cases where the entered meeting duration does not meet the specified criteria.

### ***Input Format***

The input consists of an integer value 'n', representing the meeting duration.

### ***Output Format***

The output is displayed in the following format:

If the entered meeting duration meets the specified criteria, the program outputs

"Meeting scheduled successfully!"

If the entered meeting duration is invalid, the program outputs an error message indicating the issue.

"Error: Invalid meeting duration. Please enter a positive integer not exceeding 240 minutes (4 hours)."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 120

Output: Meeting scheduled successfully!

### ***Answer***

```
import java.util.Scanner;
class InvalidDurationException extends Exception{
    public InvalidDurationException(String message){
        super(message);
    }
}
public class Main{
    public static void validateMeetingDuration(int duration) throws
InvalidDurationException{
    if (duration <= 0 || duration > 240){
        throw new InvalidDurationException("Error: Invalid meeting duration.
Please enter a positive integer not exceeding 240 minutes (4 hours).");
    }
}
```

```
}  
}  
}  
public static void main(String[] args){  
    Scanner s = new Scanner(System.in);  
    int duration = s.nextInt();  
    try{  
        validateMeetingDuration(duration);  
        System.out.println("Meeting scheduled successfully!");  
    }  
    catch (InvalidDurationException e){  
        System.out.println(e.getMessage());  
    }  
    finally{  
        s.close();  
    }  
}
```

##### 1. Problem Statement

In a user registration system, there is a requirement to implement a username validation module. Users attempting to register must adhere to specific criteria for their usernames to be considered valid.

Your task is to develop a program that takes user input for a desired username and validates it according to the following rules:

The username must not contain any spaces. The username must be at least 5 characters long.

Implement a custom exception, `InvalidUsernameException`, to handle cases where the entered username does not meet the specified criteria.

##### ***Input Format***

The input consists of a string S, representing the desired username.

### **Output Format**

If the username is valid, print "Username is valid: [S]".

If the username is invalid:

1. If the username is short, print "Invalid Username: Username must be at least 5 characters long"
2. If the username contains spaces, print "Invalid Username: Username cannot contain spaces"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: John

Output: Invalid Username: Username must be at least 5 characters long

### **Answer**

```
import java.util.Scanner;
class InvalidUsernameException extends Exception{
    public InvalidUsernameException(String message){
        super(message);
    }
}
public class Main{
    public static void validateUsername(String username) throws
InvalidUsernameException{
        if (username.contains(" ")){
            throw new InvalidUsernameException("Invalid Username: Username
cannot contain spaces");
        }
        if (username.length() < 5){
            throw new InvalidUsernameException("Invalid Username: Username must
be at least 5 characters long");
        }
    }
    public static void main(String[] args){
        Scanner scanner = new Scanner(System.in);
```

```
String username = scanner.nextLine();
try{
    validateUsername(username);
    System.out.println("Username is valid: " + username);
}
catch (InvalidUsernameException e){
    System.out.println(e.getMessage());
}
finally{
    scanner.close();
}
}
```

##### 1. Problem Statement

A local municipality is implementing an online voting system for a community event and wants to ensure that only eligible voters (those aged 18 or older) can participate.

Your task is to develop a program that validates the age of individuals attempting to vote online. If the user's age is below 18, the program should throw a custom exception, `InvalidAgeException`, preventing them from casting their vote. If the input is invalid, catch the appropriate `InputMismatchException` and print the in-built exception message.

##### ***Input Format***

The input consists of an integer representing the age.

##### ***Output Format***

If the age is 18 or older, print "Eligible to vote"

If the age is below 18, print "Exception occurred: InvalidAgeException: Age is not valid to vote"

If there is any other type of exception, print "An error occurred: " followed by the in-built exception message.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 20

Output: Eligible to vote

### **Answer**

```
import java.util.*;
class InvalidAgeException extends Exception{
    public InvalidAgeException(String message){
        super(message);
    }
}
public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        try{
            int age = sc.nextInt();
            if (age < 18){
                throw new InvalidAgeException("Age is not valid to vote");
            }
            else{
                System.out.println("Eligible to vote");
            }
        }
        catch (InputMismatchException e){
            System.out.println("An error occurred: " + e.getClass().getName());
        }
        catch (InvalidAgeException e){
            System.out.println("Exception occurred: " + e.getClass().getName() + ": " +
e.getMessage());
        }
    }
}
```

```
    }  
    catch (Exception e){  
        System.out.println("An error occurred: " + e.getMessage());  
    }  
    finally{  
        sc.close();  
    }  
}  
}
```

#### Section 1 : Coding

##### 1. Problem Statement

In a file management system, users are required to provide a valid file name when creating new files. The system enforces specific rules for file names to maintain consistency and avoid potential issues. Your task is to implement a Java program named FileNameValidator that takes user input for a file name and validates it according to the specified rules.

Rules for Valid File Name:

The file name must consist of alphanumeric characters (letters and digits) only. The file name must have a minimum length of 3 characters.

Implement a custom exception, FileNameValidator, to handle cases where the entered filename does not meet the specified criteria.

***Input Format***

The input consists of a string S, representing the desired filename.

### **Output Format**

The output is displayed in the following format:

If the entered file name meets the specified criteria, the program outputs

"Valid file name"

If the entered file name does not meet the criteria and triggers the InvalidFileNameException, the program outputs

"Error: Invalid file name. It must be alphanumeric and have a minimum length of 3 characters."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: myfile123

Output: Valid file name

### **Answer**

```
import java.util.Scanner;
class InvalidFileNameException extends Exception{
    public InvalidFileNameException(String message){
        super(message);
    }
}
public class Main{
    public static void validateFileName(String fileName) throws
InvalidFileNameException{
        if (fileName.length() < 3 || !fileName.matches("[A-Za-z0-9]+")){
            throw new InvalidFileNameException(
                "Error: Invalid file name. It must be alphanumeric and have a minimum
length of 3 characters."
            );
        }
    }
    public static void main(String[] args){
```

```
Scanner sc = new Scanner(System.in);
String fileName = sc.nextLine();
sc.close();
try{
    validateFileName(fileName);
    System.out.println("Valid file name");
}
catch (InvalidFileNameException e){

##### 1. Problem Statement

You are tasked to create a program that defines a custom exception GradeException. The program should include a Student class with fields for the student's name, age, and grade. Implement a method in the Student class that checks the grade, and if the grade is below 40, it should throw a GradeException. Otherwise, it should display the student's details.

##### ***Input Format***

The input consists of three parameters in separate lines:

1. A string representing the student's name.
2. An integer representing the student's age.
3. An integer representing the student's grade.

##### ***Output Format***

The output will display the student's details if the grade is valid.

If the grade is below 40, the program will display an error message "Grade is below 40".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Alice

20

85

Output: Name: Alice

Age: 20

Grade: 85

### **Answer**

```
import java.util.Scanner;
class GradeException extends Exception{
    public GradeException(String message){
        super(message);
    }
}
class Student{
    private String name;
    private int age;
    private int grade;
    public Student(String name, int age, int grade){
        this.name = name;
        this.age = age;
        this.grade = grade;
    }
    public void checkGrade() throws GradeException{
        if (grade < 40){
            throw new GradeException("Grade is below 40");
        }
        else{
            System.out.println("Name: " + name);
            System.out.println("Age: " + age);
            System.out.println("Grade: " + grade);
        }
    }
}
```

```
public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        String name = sc.nextLine();
        int age = sc.nextInt();
        int grade = sc.nextInt();
        sc.close();
        Student student = new Student(name, age, grade);
        try{
            student.checkGrade();
        }
        catch (GradeException e){
            System.out.println(e.getMessage());
        }
    }
}
```

**Marks : 10/10**

If the entered URL is valid according to the specified format, the program prints:

"[URL] is a valid URL"

If the entered URL is not valid according to the specified format, the program prints:

"Invalid URL format: [URL]"

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: `http://www.example.com`

Output: `http://www.example.com is a valid URL`

**Answer**

```
import java.util.Scanner;
```

```
class InvalidURLExceptionFormatException extends Exception
```

```
{
```

```
    public InvalidURLExceptionFormatException(String message)
```

```
{
```

```
        super(message);
```

```
}
```

```
}
```

```
public class Main
```

```
{
```

```
public static void validateURL(String url) throws InvalidURLException  
{
```

```
    if (!(url.startsWith("http://") || url.startsWith("https://")))
```

```
    {
```

```
        throw new InvalidURLException("Invalid URL format: " + url);
```

```
    }
```

```
}
```

```
public static void main(String[] args)
```

```
{
```

```
    Scanner sc = new Scanner(System.in);
```

```
    String url = sc.nextLine();
```

```
    try
```

```
    {
```

```
        validateURL(url);
```

```
        System.out.println(url + " is a valid URL");
```

```
    } catch (InvalidURLException e)
```

```
    {
```

```
        System.out.println(e.getMessage());  
    }  
  
    sc.close();  
  
}  
  
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

An HR software system is being developed to process employee payrolls. During payroll processing, the system must ensure that no employee has a negative salary and that no employee's salary exceeds 2,00,000. If either condition occurs, the system should throw a custom exception.

Create a custom exception `InvalidSalaryException` and a class `Employee` that processes salary according to the following rules:

If salary < 0, throw `InvalidSalaryException` with the message: "Salary cannot be negative". If salary > 200000, throw `InvalidSalaryException` with the message: "Salary exceeds threshold limit". Otherwise, display: "Salary processed successfully for <empName>: <salary>".

The payroll processing should always display: "Payroll process completed" at the end, regardless of whether an exception occurs.

#### **Input Format**

The first line of input contains an integer representing the employee ID.

The second line contains a string representing the employee's name.

The third line contains a floating-point number representing the salary of the employee.

### **Output Format**

If the salary is valid: "Salary processed successfully for <empName>: <salary>"

"Payroll process completed"

If the salary is invalid: "<Exception Message>"

"Payroll process completed"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 101

Rahul

150000.0

Output: Salary processed successfully for Rahul: 150000.0

Payroll process completed

### **Answer**

```
import java.util.Scanner;
class InvalidSalaryException extends Exception{
    public InvalidSalaryException(String message){
        super(message);
    }
}
class Employee{
    int empId;
    String empName;
    double salary;
    public Employee(int empId, String empName, double salary){
        this.empId = empId;
        this.empName = empName;
        this.salary = salary;
    }
    public void processSalary() throws InvalidSalaryException{
        if (salary < 0){
            throw new InvalidSalaryException("Salary cannot be negative");
        }
    }
}
```

```

        else if (salary > 200000){
            throw new InvalidSalaryException("Salary exceeds threshold limit");
        }
        else{
            System.out.println("Salary processed successfully for " + empName + ": "
+ salary);
        }
    }
}

public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int empId = Integer.parseInt(sc.nextLine());
        String empName = sc.nextLine();
        double salary = Double.parseDouble(sc.nextLine());
        Employee emp = new Employee(empId, empName, salary);
        try{
            emp.processSalary();
        }
        catch (InvalidSalaryException e){
            System.out.println(e.getMessage());
        }
        finally{
            System.out.println("Payroll process completed");
        }
        sc.close();
    }
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Daniel is developing a program to verify the age of users. He wants to ensure that the entered age is within a valid range. Write a program to help Daniel implement this age-checking feature using custom exceptions.

Daniel needs a program that takes an integer input representing a person's age. If the age is between 0 and 150 (inclusive), the program should print "Age is valid!". If the age is less than 0 or greater than 150, the program

should throw a custom exception (InvalidAgeException) with the message "Invalid age. Please enter an age between 0 and 150."

Implement a custom exception, InvalidAgeException, to handle cases where the entered age does not meet the specified criteria.

### ***Input Format***

The input consists of an integer value 'n', representing the age.

### ***Output Format***

The output is displayed in the following format:

If the age is valid (between 0 and 150, inclusive), print

"Age is valid!".

If the age is invalid, print

"Error: Invalid age. Please enter an age between 0 and 150."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 45

Output: Age is valid!

### ***Answer***

```
import java.util.Scanner;
class InvalidAgeException extends Exception{
    public InvalidAgeException(String message){
        super(message);
    }
}
public class Main{
    public static void checkAge(int age) throws InvalidAgeException{
        if (age < 0 || age > 150){
            throw new InvalidAgeException("Invalid age. Please enter an age between
0 and 150.");
        }
    }
}
```

```
}
else{
    System.out.println("Age is valid!");
}
}
public static void main(String[] args){
    Scanner sc = new Scanner(System.in);
    int age = sc.nextInt();
    try{
        checkAge(age);
    }
    catch (InvalidAgeException e){
        System.out.println("Error: " + e.getMessage());
    }
}
```

##### 1. Problem Statement

Faustus is managing his bank account and wants to create a program to update his account balance based on certain conditions. However, he needs to handle specific scenarios related to invalid inputs and insufficient balances. Faustus wants to update his account balance. He inputs the current balance and the amount to be updated.

The initial account balance should be positive. If Faustus enters a negative initial balance, the program should throw an `InvalidAmountException` with the message "Invalid amount. Please enter a positive initial balance." If the amount to be updated is negative, the program should check if the subtraction results in a negative balance. If so, it should throw an `InsufficientBalanceException` with the message "Insufficient balance." If the amount to be updated is positive, it should be added to the current balance, and the new balance should be printed.

Implement a custom exception, InvalidAmountException, and InsufficientBalanceException, to manage his bank account.

### ***Input Format***

The first line of input consists of a double value 'd', representing the initial account balance.

The second line of input consists of a double value 'd1', representing the amount to be updated.

### ***Output Format***

The output is displayed in the following format:

If the validation passes, print

"Account balance updated successfully! New balance: {new\_balance}"

where {new\_balance} is the updated account balance.

If the initial bank amount is negative it displays

"Error: Invalid amount. Please enter a positive initial balance."

If the updated amount exceeds the initial account balance in withdrawal it displays

"Error: Insufficient balance."

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1000  
500

Output: Account balance updated successfully! New balance: 1500.0

### ***Answer***

```
import java.util.Scanner;  
class InvalidAmountException extends Exception{
```

```

    public InvalidAmountException(String message){
        super(message);
    }
}
class InsufficientBalanceException extends Exception{
    public InsufficientBalanceException(String message){
        super(message);
    }
}
public class Main{
    public static double updateBalance(double balance, double amount)
        throws InvalidAmountException, InsufficientBalanceException{
        if (balance < 0){
            throw new InvalidAmountException("Invalid amount. Please enter a
positive initial balance.");
        }
        double newBalance = balance + amount;
        if (amount < 0 && newBalance < 0){
            throw new InsufficientBalanceException("Insufficient balance.");
        }
        System.out.println("Account balance updated successfully! New balance: " +
newBalance);
        return newBalance;
    }
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        double balance = sc.nextDouble();
        double amount = sc.nextDouble();
        try{
            updateBalance(balance, amount);
        }
        catch (InvalidAmountException e){
            System.out.println("Error: " + e.getMessage());
        }
        catch (InsufficientBalanceException e){
            System.out.println("Error: " + e.getMessage());
        }
    }
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

In an online shopping cart system, users can apply coupon codes during checkout to avail of discounts. However, to ensure the validity and security of coupon codes, the system enforces specific rules for their format. Your task is to implement a Java program named `CouponCodeValidator` that takes user input for a coupon code and validates it according to the specified rules.

### Rules for Valid Coupon Code:

The coupon code must consist of exactly 10 characters. The coupon code must contain at least one alphabet (uppercase or lowercase) and at least one digit (0-9). Special characters are not allowed in the coupon code.

Implement a custom exception, `InvalidCouponException`, to handle cases where the entered coupon code does not meet the specified criteria.

### ***Input Format***

The input consists of a string `s`, representing the coupon code.

### ***Output Format***

The output is displayed in the following format:

If the entered coupon code meets the specified criteria, the program outputs

"Coupon code applied successfully!"

If the entered coupon code has less than or more than 10 characters it outputs

"Error: Invalid coupon code length. It must be exactly 10 characters."

If the entered coupon code contains only numeric or only alphabets it outputs

"Error: Invalid coupon code format. It must contain at least one alphabet and one digit."

If the entered coupon code contains special characters it outputs

"Error: Coupon code should not contain special characters."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: ABCD123456

Output: Coupon code applied successfully!

### **Answer**

```
import java.util.Scanner;
class InvalidCouponException extends Exception{
    public InvalidCouponException(String message){
        super(message);
    }
}
public class Main{
    public static void validateCoupon(String code) throws
InvalidCouponException{
        if (code.length() != 10){
            throw new InvalidCouponException("Invalid coupon code length. It must
be exactly 10 characters.");
        }
        boolean hasLetter = false;
        boolean hasDigit = false;
        for (char ch : code.toCharArray()){
            if (Character.isLetter(ch)){
                hasLetter = true;
            }
            else if (Character.isDigit(ch)){
                hasDigit = true;
            }
            else{
                throw new InvalidCouponException("Coupon code should not contain
special characters.");
            }
        }
        if (!hasLetter || !hasDigit){
            throw new InvalidCouponException("Invalid coupon code format. It must
contain at least one alphabet and one digit.");
        }
        System.out.println("Coupon code applied successfully!");
    }
}
```

```

    }
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        String code = sc.nextLine();
        try{
            validateCoupon(code);
        }
        catch (InvalidCouponException e){
            System.out.println("Error: " + e.getMessage());
        }
    }
}

```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

Camila, a user of a social media platform, is looking to change her password to enhance account security. The platform enforces specific rules for password strength to ensure the safety of user accounts. Camila needs a program that prompts her to enter a new password and throws custom exceptions based on the strength of the password.

Password Strength Criteria:

Weak Password:

Length less than 8 characters.

Medium Password:  
Length 8 or more characters. Missing a mix of uppercase letters, lowercase letters, and digits.

Implement a custom exception, to assist Camila in changing her password securely. The program should interactively take user input for a new password, categorize its strength, and handle custom exceptions (WeakPasswordException and MediumPasswordException) if the password fails to meet the specified criteria.

#### **Input Format**

The input consists of a string *s*, representing the new password.

### **Output Format**

The output is displayed in the following format:

If the entered password meets the strength criteria, the program outputs

"Password changed successfully!"

If the entered password is weak, the program outputs

"Error: Weak password. It must be at least 8 characters long."

If the entered password is of medium strength, the program outputs

"Error: Medium password. It must include a mix of uppercase letters, lowercase letters, and digits."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: ComplexP@ss1

Output: Password changed successfully!

### **Answer**

```
import java.util.Scanner;
class WeakPasswordException extends Exception{
    public WeakPasswordException(String message){
        super(message);
    }
}
class MediumPasswordException extends Exception{
    public MediumPasswordException(String message){
        super(message);
    }
}
public class Main{
    public static void validatePassword(String password)
        throws WeakPasswordException, MediumPasswordException{
        if (password.length() < 8){
```

```

        throw new WeakPasswordException("Weak password. It must be at least
        8 characters long.");
    }
    boolean hasUpper = false;
    boolean hasLower = false;
    boolean hasDigit = false;
    for (char ch : password.toCharArray()){
        if (Character.isUpperCase(ch)){
            hasUpper = true;
        }
        else if (Character.isLowerCase(ch)){
            hasLower = true;
        }
        else if (Character.isDigit(ch)){
            hasDigit = true;
        }
    }
    if (!(hasUpper && hasLower && hasDigit)){
        throw new MediumPasswordException("Medium password. It must
        include a mix of uppercase letters, lowercase letters, and digits.");
    }

```

```

        System.out.println("Password changed successfully!");
    }
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        String password = sc.nextLine();
        try{
            validatePassword(password);
        }
        catch (WeakPasswordException e){
            System.out.println("Error: " + e.getMessage());
        }
        catch (MediumPasswordException e){
            System.out.println("Error: " + e.getMessage());
        }
    }
}

```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Hemanth is designing a banking system for XYZ Bank. The system should allow customers to perform deposit, withdrawal, and balance inquiry operations. Implement exception handling for scenarios involving invalid transaction amounts or insufficient funds.

Create two custom exception classes, `InvalidAmountException` and `InsufficientFundsException`, both extending the `Exception` class. Throw an `InvalidAmountException` with a message if the deposit amount is less than or equal to zero. Throw an `InsufficientFundsException` if the withdrawal amount is greater than the available balance. Deduct the withdrawal amount from the balance if the withdrawal is successful.

Assist Hemanth in designing the program.

##### ***Input Format***

The first line of input consists of a double value `B`, representing the initial balance.

The second line consists of a double value `D`, representing the deposit amount.

The third line consists of a double value `W`, representing the withdrawal amount.

##### ***Output Format***

If the withdrawal is successful, print the amount withdrawn and the current balance, rounded off to one decimal place.

If an `InvalidAmountException` occurs, print "Error: [`D`] is not valid".

If an `InsufficientFundsException` occurs, print "Error: Insufficient funds".

Refer to the sample output for formatting specifications.

##### ***Sample Test Case***

Input: 1050.1  
270.2  
150.3

Output: Amount Withdrawn: 150.3  
Current Balance: 1170.0

**Answer**

```
import java.util.Scanner;
class InvalidAmountException extends Exception{
    public InvalidAmountException(String message){
        super(message);
    }
}
class InsufficientFundsException extends Exception{
    public InsufficientFundsException(String message){
        super(message);
    }
}
public class Main{
    public static double deposit(double balance, double amount) throws
InvalidAmountException{
        if (amount <= 0){
            throw new InvalidAmountException(amount + " is not valid");
        }
        return balance + amount;
    }
    public static double withdraw(double balance, double amount) throws
InsufficientFundsException{
        if (amount > balance){
            throw new InsufficientFundsException("Insufficient funds");
        }
        return balance - amount;
    }
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        double balance = sc.nextDouble();
        double depositAmount = sc.nextDouble();
        double withdrawAmount = sc.nextDouble();
        try{
            balance = deposit(balance, depositAmount);
            balance = withdraw(balance, withdrawAmount);
            System.out.println("Amount Withdrawn: " + withdrawAmount);
            System.out.printf("Current Balance: %.1f\n", balance);
        }
        catch (InvalidAmountException e){
```

```
        System.out.println("Error: " + e.getMessage());
    }
    catch (InsufficientFundsException e){
        System.out.println("Error: " + e.getMessage());
    }
}
}
```

## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 9\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. Which method is used to add an element to the top of the stack?

**Answer**

push()

**Status : Correct**

**Marks : 1/1**

2. How can you access the first element of an ArrayList named as list?

**Answer**

list.get(0);

**Status : Correct**

**Marks : 1/1**

3. Which of the following methods removes and returns the last element from a LinkedList?

**Answer**

removeLast()

**Status :** Correct

**Marks :** 1/1

4. What will be the output of the following code?

```
import java.util.ArrayList;
```

```
public class Main {  
    public static void main(String[] args) {  
        ArrayList<String> list = new ArrayList<>();  
        list.add("Apple");  
        list.add("Banana");  
        list.remove("Apple");  
        System.out.println(list);  
    }  
}
```

**Answer**

[Banana]

**Status :** Correct

**Marks :** 1/1

5. What is the correct way to create an ArrayList in Java?

**Answer**

```
ArrayList<String> list = new ArrayList<>();
```

**Status :** Correct

**Marks :** 1/1

6. What does the addFirst() method of LinkedList do?

**Answer**

Adds an element to the beginning of the list

**Status :** Correct

**Marks :** 1/1

7. What will be the output of the following code?

```
import java.util.ArrayList;
```

```
public class Main {  
    public static void main(String[] args) {  
        ArrayList<Integer> list = new ArrayList<>();  
        list.add(10);  
        list.add(20);  
        list.add(30);  
        System.out.println("Size of the list: " + list.size());  
    }  
}
```

**Answer**

Size of the list: 3

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following code?

```
import java.util.*;  
class Main {  
    public static void main(String[] args) {  
        ArrayList<Integer> list = new ArrayList<>();  
        list.add(1);  
        list.add(2);  
        list.add(3);  
        list.add(4);  
        list.set(2, 10);  
        System.out.println(list);  
    }  
}
```

**Answer**

[1, 2, 10, 4]

Status : Correct

Marks : 1/1

9. What will be the output of the following code?

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Stack<Integer> stack = new Stack<>();
        for (int i = 1; i <= 3; i++)
            stack.push(i * 2);
        stack.pop();
        stack.push(10);
        System.out.println(stack.peek());
    }
}
```

Answer

10

Status : Correct

Marks : 1/1

10. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        ArrayList<Integer> list = new ArrayList<>();
        list.add(10);
        list.add(20);
        list.add(30);
        list.remove(1);
        System.out.println(list);
    }
}
```

Answer

[10, 30]

**Status :** Correct

**Marks :** 1/1

11. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        ArrayList<String> list = new ArrayList<>();
        list.add("apple");
        list.add("banana");
        list.add("cherry");
        list.add("banana");
        System.out.println(list.lastIndexOf("banana"));
    }
}
```

**Answer**

3

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        ArrayList<String> list = new ArrayList<>();
        list.add("Java");
        list.add("Python");
        list.add("Java");
        list.add("C++");
        System.out.println(list.indexOf("Java"));
    }
}
```

**Answer**

0

**Status :** Correct

**Marks :** 1/1

13. What will be the output of the following code?

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Stack<Integer> s = new Stack<>();
        s.push(10);
        s.push(20);
        s.push(30);
        System.out.println(s.peek());
    }
}
```

**Answer**

30

**Status :** Correct

**Marks :** 1/1

14. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        ArrayList<Integer> list = new ArrayList<>();
        list.add(1);
        list.add(2);
        list.add(3);
        list.add(4);
        list.add(5);
        System.out.println(list.get(3));
    }
}
```

**Answer**

4

**Status :** Correct

**Marks :** 1/1

15. What is Collection in Java?

**Answer**

A group of objects

**Status :** Correct

**Marks :** 1/1

##### 1. Problem Statement

Bobby is tasked with processing a sequence of numbers from a monitoring system. He needs to extract a strictly increasing subsequence using an ArrayList. The program should dynamically add numbers to the ArrayList only if they are greater than the last number currently stored in the list. Bobby aims to efficiently utilize the dynamic resizing and indexing features of the ArrayList to solve this problem.

Help Bobby implement this solution.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of elements.

The second line consists of N space-separated integers, representing the elements.

### **Output Format**

The output prints the list of integers in increasing sequence, ignoring out-of-order elements.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 7

3 5 9 1 11 7 13

Output: [3, 5, 9, 11, 13]

### **Answer**

```
import java.util.ArrayList;
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int N = sc.nextInt();
        ArrayList<Integer> seq = new ArrayList<>();
        for (int i = 0; i < N; i++){
            int num = sc.nextInt();
            if (seq.isEmpty() || num > seq.get(seq.size() - 1)){
                seq.add(num);
            }
        }
        System.out.println(seq);
        sc.close();
    }
}
```

#### Section 1 : Coding

##### 1. Problem Statement

Assist Pranitha in developing a program that takes an integer N as input, representing the number of names to be read. Then read N names and store them in an ArrayList. Finally, input a search string and output the frequency of that string in the list of names.

Note: Some parts of the code are provided as snippets, and you need to complete the remaining sections by writing the necessary code.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of names to be read.

The following N lines consist of N names, as a string.

The last line consists of a string, representing the name to be searched.

### **Output Format**

The output prints a single integer, representing the frequency of the specified name in the given list.

If the specified name is not found, print 0.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

Alice

Bob

Ankit

Alice

Pranitha

Alice

Output: 2

### **Answer**

```
import java.util.ArrayList;
import java.util.Scanner;
public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int N = sc.nextInt();
        sc.nextLine();
        ArrayList<String> names = new ArrayList<>();
        for (int i = 0; i < N; i++){
            names.add(sc.nextLine());
        }
        String search = sc.nextLine();
        int count = 0;
        for (String name : names){
            if (name.equals(search)){
                count++;
            }
        }
    }
}
```

```
        System.out.println(count);  
        sc.close();  
    }  
}

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 9\_Q2

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Vikram loves listening to music and wants to create a simple playlist manager using Java Collections. The playlist supports the following operations:

"ADD <song>" Adds the song to the end of the playlist. "REMOVE <song>" Removes the first occurrence of the song from the playlist. If the song is not found, do nothing. "SHOW" Displays all songs in the playlist in order. If the playlist is empty, print "EMPTY". "NEXT" Moves to the next song in the playlist and prints its name. If the playlist is empty, print "EMPTY".

The playlist maintains a "current song" position that starts at the first song when it's added. The NEXT command moves to the next song and prints it, wrapping around to the first song after reaching the last song. When removing songs, the current position adjusts accordingly to maintain

proper navigation.

Help Vikram implement this playlist manager.

### ***Input Format***

The first line of the input consists of an integer n, the number of operations.

The next n lines, each containing a command:

- "ADD <song>"
- "REMOVE <song>"
- "SHOW"
- "NEXT"

### ***Output Format***

For each "SHOW" command, print the songs in order, separated by spaces.

For each "NEXT" command, print the next song in the playlist.

If no song exists, print "EMPTY".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 7

ADD song1

ADD song2

SHOW

NEXT

REMOVE song2

SHOW

NEXT

Output: song1 song2

song2

song1

song1

### ***Answer***

```
if (playlist.isEmpty()){  
    System.out.println("EMPTY");  
}  
else{  
    current = (current + 1) % playlist.size();  
    System.out.println(playlist.get(current));  
}  
break;
```

#### Section 1 : Coding

##### 1. Problem Statement

Aditi is analyzing stock market trends and wants to find the Next Greater Element (NGE) for each stock price in a list. The Next Greater Element for an element  $x$  in an array is the first element to the right that is greater than  $x$ . If no greater element exists, return -1 for that position.

Your task is to help Aditi by efficiently computing the Next Greater Element for each element in the given array using a Stack.

Example:

Input:

6

4 5 2 10 8 6

Output:

5 10 10 -1 -1 -1

Explanation:

For each element:

4 5 (next greater element)5 102 1010 -1 (No greater element)8 -16 -1

### ***Input Format***

The first line contains an integer n, representing the number of elements.

The second line contains n space-separated integers arr[i], where arr[i] is the stock price on the i-th day.

### ***Output Format***

The output prints n space-separated integers representing the Next Greater Element for each element in the array.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 6

4 5 2 10 8 6

Output: 5 10 10 -1 -1 -1

### ***Answer***

```
import java.util.*;
public class Main {
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        int[] arr = new int[n];
        int[] nge = new int[n];
        for (int i = 0; i < n; i++) {
            arr[i] = sc.nextInt();
            nge[i] = -1;
        }
        Stack<Integer> stack = new Stack<>(); // stores indices
```

```

for (int i = 0; i < n; i++) {
    while (!stack.isEmpty() && arr[i] > arr[stack.peek()]){
        nge[stack.pop()] = arr[i];
    }
    stack.push(i);
}
for (int i = 0; i < n; i++) {
    System.out.print(nge[i] + " ");
}
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Rekha is a teacher who wants to calculate the average of marks scored by her students in a test. She needs to store all the marks dynamically because the number of students may vary each time. Using an ArrayList allows her to easily add any number of marks without worrying about the initial size.

Help her implement the task.

### **Input Format**

The first line of input is an integer  $n$ , representing the number of students..

The second line of input consists of  $n$  double values, representing the marks of each student, separated by a space.

### **Output Format**

The output prints: "Average of the list: " followed by the average value formatted to two decimal places.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 5

1.0 2.0 3.0 4.0 5.0

Output: Average of the list: 3.00

**Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        ArrayList<Double> marks = new ArrayList<>();
        for (int i = 0; i < n; i++){
            marks.add(sc.nextDouble());
        }
        double sum = 0.0;
        for (double m : marks) {
            sum += m;
        }
        double average = sum / n;
        System.out.printf("Average of the list: %.2f", average);
    }
}
```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

Arun is building a task manager to keep track of tasks using a LinkedList. The task manager supports the following operations:

"ADD <task>" Adds the given task to the end of the list."REMOVE"

Removes the first task from the list."SHOW" Displays all tasks in the list in order. If the list is empty, print "EMPTY".

Help Arun implement this functionality using a LinkedList.

#### **Input Format**

The first line of the input consists of an integer n, the number of operations.

The next n lines, each containing a command:

- "ADD <task>"
- "REMOVE"
- "SHOW"

### **Output Format**

For each "SHOW" command, the output prints the tasks in order, separated by spaces.

If no tasks exist, print "EMPTY".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

ADD homework

ADD project

SHOW

REMOVE

SHOW

Output: homework project  
project

### **Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        LinkedList<String> tasks = new LinkedList<>();
        while (n-- > 0){
            String command = sc.nextLine();
            if (command.startsWith("ADD")){
                String task = command.substring(4);
                tasks.add(task);
            }
            else if (command.equals("REMOVE")){
                if (!tasks.isEmpty()){
                    tasks.removeFirst();
                }
            }
        }
    }
}
```

```
    }  
  }  
  else if (command.equals("SHOW")){  
    if (tasks.isEmpty()) {  
      System.out.println("EMPTY");  
    } else{  
      for (String t : tasks){  
        System.out.print(t + " ");  
      }  
      System.out.println();  
    }  
  }  
}
```

#### Section 1 : Coding

##### 1. Problem Statement

Sanjay is working on a program to merge two sorted linked lists into a single sorted list using Java's LinkedList class from the Collections framework. Given two sorted linked lists, he wants to merge them while maintaining the sorted order.

Write a Java program that:

Reads two sorted linked lists. Merges them into a single sorted linked list. Prints the merged list in ascending order.

##### ***Input Format***

The first line contains an integer  $m$  (the size of the first linked list).

The second line contains  $m$  space-separated integers (sorted).

The third line contains an integer n (the size of the second linked list).

The fourth line contains n space-separated integers (sorted).

### ***Output Format***

The output prints the merged linked list as space-separated integers.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 2

5 10

3

1 3 8

Output: 1 3 5 8 10

### ***Answer***

```
import java.util.*;
class MergeSortedLinkedLists {
// You are using Java

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);
        int m = sc.nextInt();
        LinkedList<Integer> list1 = new LinkedList<>();
        for (int i = 0; i < m; i++){
            list1.add(sc.nextInt());
        }

        int n = sc.nextInt();
        LinkedList<Integer> list2 = new LinkedList<>();
        for (int i = 0; i < n; i++) {
            list2.add(sc.nextInt());
        }

        LinkedList<Integer> merged = new LinkedList<>();
```

```

int i = 0, j = 0;

while (i < list1.size() && j < list2.size()) {
    if (list1.get(i) <= list2.get(j)) {
        merged.add(list1.get(i));
        i++;
    }
    else {
        merged.add(list2.get(j));
        j++;
    }
}

while (i < list1.size()) {
    merged.add(list1.get(i));
    i++;
}

while (j < list2.size()) {
    merged.add(list2.get(j));
    j++;
}
for (int val : merged){
    System.out.print(val + " ");
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Mesa, a store manager, needs a program to manage inventory items. Define a class ItemType with private attributes for name, deposit, and cost per day. Create an ArrayList in the Main class to store ItemType objects, allowing input and display.

Note: Use "%-20s%-20s%-20s" for formatting output in tabular format,

display double values with 1 decimal place.

### ***Input Format***

The first line of input consists of an integer n, representing the number of items.

For each of the n items, there are three lines:

1. The name of the item (a string)
2. The deposit amount (a double value)
3. The cost per day (a double value)

### ***Output Format***

The output prints a formatted table with columns for name, deposit and cost per day.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 3

Laptop

10000.0

250.0

Light

1000.0

50.0

Fan

1000.0

100.0

Output: Name                      Deposit                      Cost Per Day

Laptop                      10000.0                      250.0

Light                      1000.0                      50.0

Fan                      1000.0                      100.0

### ***Answer***

```
import java.util.ArrayList;
```

```
import java.util.List;
```

```
import java.util.Scanner;
```

```
// You are using Java
class ItemType {
    private String name;
    private double deposit;
    private double costPerDay;
    public ItemType(String name, double deposit, double costPerDay) {
        this.name = name;
        this.deposit = deposit;
        this.costPerDay = costPerDay;
    }
    public String toString() {
        return String.format("%-20s%-20.1f%-20.1f", name, deposit, costPerDay);
    }
}

class ArrayListObjectMain {
    public static void main(String args[]) {
        List<ItemType> items = new ArrayList<>();
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());

        for (int i = 0; i < n; i++) {
            String name = sc.nextLine();
            Double deposit = Double.parseDouble(sc.nextLine());
            Double costPerDay = Double.parseDouble(sc.nextLine());
            items.add(new ItemType(name, deposit, costPerDay));
        }
        System.out.format("%-20s%-20s%-20s", "Name", "Deposit", "Cost Per Day");
        System.out.println();

        for (ItemType item : items) {
            System.out.println(item);
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Aarav is developing a music playlist application where users can manage

their favorite songs. He wants to implement a feature that allows users to reorder the playlist by moving a song from one position to another.

You need to implement a function that performs the following operations using a LinkedList:

Add songs to the playlist in the given order. Move a song from a specified position to another position in the playlist. Print the final playlist after all operations.

### ***Input Format***

The first line of the input consists of an integer  $n$  representing the number of songs.

The next  $n$  lines, each containing a string representing a song name.

After the songs are given the next line contains an integer  $m$ , the number of move operations.

The next  $m$  lines, each containing two integers  $x$  and  $y$  representing the move operation where the song at position  $x$  (0-based index) should be moved to position  $y$ .

### ***Output Format***

The output prints the final playlist, each song on a new line.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

SongA

SongB

SongC

SongD

SongE

2

2 4

0 3

Output: SongB  
SongD  
SongE  
SongA  
SongC

**Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine().trim());
        LinkedList<String> playlist = new LinkedList<>();
        for (int i = 0; i < n; i++) {
            playlist.add(sc.nextLine().trim());
        }
        int m = Integer.parseInt(sc.nextLine().trim());
        for (int i = 0; i < m; i++) {
            int x = sc.nextInt();
            int y = sc.nextInt();
            String song = playlist.remove(x);
            playlist.add(y, song);
        }
        for (String song : playlist) {
            System.out.println(song);
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

A teacher is filtering a list of words provided by students. Some words contain too many vowels, making them difficult for a spelling competition. The teacher decides to remove all words that contain more than two vowels.

Help the teacher to implement it using ArrayList.

### ***Input Format***

The first line contains an integer N, representing the number of words in the list.

The next N lines contain a string representing the words (one per line).

### ***Output Format***

The output consists of words that contain two or less than two vowels, printed in the same order they appeared in the input. Each word is printed on a new line.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 1

sri

Output: sri

### ***Answer***

```
import java.util.ArrayList;
import java.util.Scanner;

// You are using Java
class VowelFilter {
    public static void filterWords(int n, Scanner sc){
        ArrayList<String> words = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            words.add(sc.nextLine());
        }
        for (String word : words) {
            if (countVowels(word) <= 2){
                System.out.println(word);
            }
        }
    }
    private static int countVowels(String s) {
        int count = 0;
        for (char c : s.toCharArray()) {
            if ("aeiou".indexOf(c) != -1) {
                count++;
            }
        }
    }
}
```

```
    }  
    return count;  
  }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int n = sc.nextInt();  
        sc.nextLine();  
        VowelFilter.filterWords(n, sc);  
        sc.close();  
    }  
}
```

### REC\_2028\_OOPS using Java\_Week 10\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 15

#### Section 1 : MCQ

1. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, String> map = new HashMap<>();
        map.put("A", "Apple");
        map.put("B", "Banana");
        map.put("C", "Cherry");
        map.replace("B", "Blueberry");
        System.out.println(map);
    }
}
```

**Answer**

{A=Apple, B=Blueberry, C=Cherry}

**Status :** Correct

**Marks :** 1/1

2. What happens when you add duplicate elements to a HashSet?

**Answer**

The duplicate is ignored

**Status :** Correct

**Marks :** 1/1

3. What will happen if you add elements in descending order in a TreeSet?

**Answer**

They are sorted in ascending order

**Status :** Correct

**Marks :** 1/1

4. How does HashSet check for duplicate elements?

**Answer**

Using equals() and hashCode()

**Status :** Correct

**Marks :** 1/1

5. Which method removes all elements from a Set?

**Answer**

clear()

**Status :** Correct

**Marks :** 1/1

6. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, Integer> map = new HashMap<>();
```

```
map.put("A", 1);  
map.put("B", 2);  
map.put("C", 3);  
System.out.println(map.containsKey("B"));  
}  
}
```

**Answer**

true

**Status :** Correct

**Marks :** 1/1

7. Which of the following is true about TreeMap?

**Answer**

It maintains natural ordering

**Status :** Correct

**Marks :** 1/1

8. Which of the following allows null keys in Java?

**Answer**

HashMap

**Status :** Correct

**Marks :** 1/1

9. What will happen if you add a null element to a TreeSet?

**Answer**

An exception occurs

**Status :** Correct

**Marks :** 1/1

10. Which of the following is true about HashMap?

**Answer**

It is not synchronized

**Status :** Correct

**Marks :** 1/1

11. Which method retrieves the lowest key in a TreeMap?

**Answer**

firstKey()

**Status :** Correct

**Marks :** 1/1

12. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, Integer> map = new HashMap<>();
        map.put("X", 10);
        map.put("Y", 20);
        map.put("Z", 30);
        map.remove("Y");
        System.out.println(map);
    }
}
```

**Answer**

{X=10, Z=30}

**Status :** Correct

**Marks :** 1/1

13. What is the time complexity of retrieving an element from a HashSet?

**Answer**

O(1)

**Status :** Correct

**Marks :** 1/1

14. What happens if two keys have the same hash code in a HashMap?

**Answer**

A linked list is used to store values with the same hash

**Status :** Correct

**Marks :** 1/1

15. Which statement is true about HashSet and TreeSet?

**Answer**

TreeSet provides sorted elements

**Status :** Correct

**Marks :** 1/1

##### 1. Problem Statement

A city traffic management system needs to track vehicles entering a toll booth. Each vehicle is uniquely identified by its registration number. The system should allow adding vehicles to a record, ensuring that no duplicate registration numbers exist. The vehicles should be stored in a HashSet, which does not guarantee any specific order.

Your task is to implement a program using a HashSet that allows adding vehicle details and displaying the records.

##### ***Input Format***

The first line of input contains an integer N - the number of vehicles.

The next N lines contain details of each vehicle in the format: "RegNumber

OwnerName VehicleType"

1. RegNumber (String) - A unique registration number (Alphanumeric).
2. OwnerName (String) - The name of the vehicle owner.
3. VehicleType (String, Car, Bike, or Truck) - The type of vehicle.

If a vehicle with the same registration number is already present, ignore the duplicate entry.

### **Output Format**

The output prints the unique vehicle records in any order (since HashSet does not maintain order).

Output format: "RegNumber OwnerName VehicleType"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

KA01AB1234 John Car

MH02CD5678 Alice Bike

DL03EF9012 Bob Truck

TN04GH3456 Mike Car

KA01AB1234 John Car

Output: TN04GH3456 Mike Car

KA01AB1234 John Car

MH02CD5678 Alice Bike

DL03EF9012 Bob Truck

### **Answer**

```
import java.util.*;
class Vehicle {
    String regNumber;
    String ownerName;
    String vehicleType;
    public Vehicle(String regNumber, String ownerName, String vehicleType){
        this.regNumber = regNumber;
        this.ownerName = ownerName;
        this.vehicleType = vehicleType;
    }
}
```

```

    }
    public boolean equals(Object obj) {
        if (this == obj) return true;
        if (!(obj instanceof Vehicle)) return false;
        Vehicle v = (Vehicle) obj;
        return this.regNumber.equals(v.regNumber);
    }
    public int hashCode() {

        return regNumber.hashCode();
    }
    public String toString(){
        return regNumber + " " + ownerName + " " + vehicleType;
    }
}
public class Main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        HashSet<Vehicle> vehicles = new HashSet<>();
        for (int i = 0; i < n; i++){
            String line = sc.nextLine();
            String[] parts = line.split(" ");
            String reg = parts[0];
            String owner = parts[1];
            String type = parts[2];
            vehicles.add(new Vehicle(reg, owner, type));
        }
        for (Vehicle v : vehicles){
            System.out.println(v);
        }
    }
}

```

**Status :** Correct

##### 1. Problem Statement

John is organizing a fruit festival, and the quantities of various fruits are stored in a HashMap where fruit names are keys and quantities are values.

Help him develop a program to find the total quantity of fruits for the festival by summing up the values in the HashMap.

##### ***Input Format***

The input consists of fruit quantities in the format 'fruitName:quantity', where fruitName is the name of the fruit(a string), and quantity is a double value representing the quantity.

The input is terminated by entering "done".

##### ***Output Format***

The output prints a double value, representing the sum of values in the HashMap, rounded off to two decimal places.

If the value is not numeric, print "Invalid input".

If any special characters other than ':' are entered, print "Invalid format".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Banana:15.2

Orange:56.3

Mango:47.3

done

Output: 118.80

### **Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        HashMap<String, Double> map = new HashMap<>();
        double sum = 0.0;
        while (true) {
            String input = sc.nextLine();
            if (input.equals("done")) {
                break;
            }
            if (!input.contains(":")) {
                System.out.println("Invalid format");
                return;
            }
            for (char c : input.toCharArray()) {
                if (!Character.isLetterOrDigit(c) && c != ':' && c != '.'){
                    System.out.println("Invalid format");
                    return;
                }
            }
            String[] parts = input.split(":");
```

```
    if (parts.length != 2) {  
        System.out.println("Invalid format");  
        return;  
    }  
    String fruit = parts[0];  
    String quantityStr = parts[1];  
    try {  
        double qty = Double.parseDouble(quantityStr);  
        map.put(fruit, qty);  
    }  
    catch (NumberFormatException e){  
        System.out.println("Invalid input");  
        return;  
    }  
}  
for (double val : map.values()) {  
    sum += val;  
}  
System.out.printf("%.2f", sum);  
}  
}
```

#### Section 1 : COD

##### 1. Problem Statement

Priya is analyzing encrypted messages in a research project. She wants to analyze the frequency of each character in a given paragraph. The characters should be stored in a TreeMap so that the output is sorted in ascending order of characters automatically.

You are required to build a Java program that:

Uses a `TreeMap<Character, Integer>` to count how many times each character appears in the message. Ignores spaces and considers only alphabets (case-sensitive). Outputs the frequencies of characters in sorted order.

You must use a TreeMap in the class named MessageAnalyzer.

***Input Format***

The first line of input contains an integer n, the number of lines in the message.

The next n lines each contain a string (the encrypted message line).

### **Output Format**

The first line of output prints: "Character Frequency:"

Then print each character and its frequency in the format: "<character>: <count>"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 2  
Hello World  
Java

Output: Character Frequency:

H: 1

J: 1

W: 1

a: 2

d: 1

e: 1

l: 3

o: 2

r: 1

v: 1

### **Answer**

```
import java.util.*;
class MessageAnalyzer{
    public static void analyze(List<String> lines) {
        TreeMap<Character, Integer> map = new TreeMap<>();
        for (String line : lines) {
            for (char ch : line.toCharArray()) {
                if (ch != ' ' && Character.isLetter(ch)) {
                    map.put(ch, map.getDefault(ch, 0) + 1);
                }
            }
        }
    }
}
```

```
        System.out.println("Character Frequency:");
        for (Map.Entry<Character, Integer> entry : map.entrySet()) {
            System.out.println(entry.getKey() + ": " + entry.getValue());
        }
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.nextLine();
        List<String> lines = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            lines.add(sc.nextLine());
        }
        MessageAnalyzer.analyze(lines);
    }
}
```

##### 1. Problem Statement

In a ticket reservation system, you store the available seat numbers in a TreeSet. Users input their desired seat number, and the program checks whether the chosen seat is available.

Using a TreeSet ensures quick and efficient verification of seat availability, ensuring a smooth and organized ticket booking process.

##### ***Input Format***

The first line of input contains a single integer  $n$ , representing the number of available seats.

The second line contains  $n$  space-separated integers, representing the available seat numbers.

The third line contains an integer  $m$ , representing the seat number that needs to be searched.

### **Output Format**

The output displays "[ $m$ ] is present!" if the given seat is available. Otherwise, it displays "[ $m$ ] is not present!"

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 4

2 4 5 6

5

Output: 5 is present!

### **Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        TreeSet<Integer> seats = new TreeSet<>();
        for (int i = 0; i < n; i++) {
            seats.add(sc.nextInt());
        }
        int m = sc.nextInt();
        if (seats.contains(m)) {
            System.out.println(m + " is present!");
        }
        else {
            System.out.println(m + " is not present!");
        }
    }
}

##### 1. Problem Statement

Sarah is working on a spam detection system that analyzes incoming messages for unique patterns. Spammers often use repetitive character sequences, making it important to identify the first non-repeating character in a message.

Given a string, Sarah needs to determine the first character that appears only once. If all characters repeat, the system should return -1.

She decides to use a HashMap to efficiently track character frequencies and find the solution.

##### ***Input Format***

The first line contains an integer N representing , the length of the string.

The second line contains a string of N lowercase English letters (a-z).

### **Output Format**

The output prints a character representing the first non-repeating character. If none exist, print -1.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 10  
abacabadac

Output: d

### **Answer**

```
import java.util.*;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String nLine = "";
        while (nLine.isEmpty() && sc.hasNextLine()) {
            nLine = sc.nextLine().trim();
        }
        if (nLine.isEmpty()) {
            System.out.println("-1");
            return;
        }
        int n;
        try {
            n = Integer.parseInt(nLine);
        }
        catch (NumberFormatException e) {
            System.out.println("-1");
            return;
        }
        StringBuilder sb = new StringBuilder();
        while (sb.length() < n && sc.hasNextLine()) {
            String line = sc.nextLine();
            sb.append(line);
        }
    }
}
```

```

    }
    if (sb.length() < n){
    }
    String s = sb.toString();
    if (s.length() > n) {
        s = s.substring(0, n);
    }
    Map<Character, Integer> freq = new HashMap<>();
    for (int i = 0; i < s.length(); i++) {
        char c = s.charAt(i);
        freq.put(c, freq.getDefault(c, 0) + 1);
    }
    for (int i = 0; i < s.length(); i++) {
        char c = s.charAt(i);
        if (freq.getDefault(c, 0) == 1) {
            System.out.println(c);
            return;
        }
    }

    System.out.println("-1");
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Riya is building a calendar event scheduler where each event is stored in chronological order using a TreeMap. The key represents the event time in 24-hour format (HH:MM), and the value is the event description.

She wants the system to:

Automatically sort events by time. Avoid duplicate time entries — if a duplicate time is entered, ignore the new entry. Print all scheduled events in order.

Implement this logic using a class named EventManager.

**Input Format**

The first line of the input contains an integer n, representing the number of events.

The next n lines each contain a string in the format: "HH:MM Description"

(Example: 09:00 TeamMeeting).

### **Output Format**

The first line of the output prints "Scheduled Events:"

The next k lines print each event in the format: "HH:MM - Description"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

09:00 TeamMeeting

13:30 LunchBreak

11:00 ProjectUpdate

09:00 Standup

15:00 ClientCall

Output: Scheduled Events:

09:00 - TeamMeeting

11:00 - ProjectUpdate

13:30 - LunchBreak

15:00 - ClientCall

### **Answer**

```
import java.util.*;
class EventManager {
    private TreeMap<String, String> events = new TreeMap<>();
    public void addEvent(String time, String description) {
        if (!events.containsKey(time)) {
            events.put(time, description);
        }
    }
    public void printEvents() {
        System.out.println("Scheduled Events:");
        for (Map.Entry<String, String> entry : events.entrySet()) {
```

```

        System.out.println(entry.getKey() + " - " + entry.getValue());
    }
}
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        EventManager manager = new EventManager();
        for (int i = 0; i < n; i++) {
            String line = sc.nextLine().trim();
            String[] parts = line.split(" ");
            String time = parts[0];
            String description = parts[1];
            manager.addEvent(time, description);
        }
        manager.printEvents();
    }
}

```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

A university maintains a list of student records and wants to store them in a sorted manner based on their GPA. If two students have the same GPA, they should be further sorted by their name in lexicographical order. Implement a program that uses a TreeSet to store student records and ensures unique student IDs.

#### ***Input Format***

The first line contains an integer N - the number of students.

The next N lines contain details of each student in the format: "StudentID Name GPA"

- StudentID (Integer) - A unique identifier.
- Name (String) - The student's name (can contain spaces).
- GPA (Double) - The Grade Point Average.

### **Output Format**

The output prints the list of students in ascending order of GPA.

If two students have the same GPA, sort them by name.

Print details in the format: "StudentID Name GPA" in the output, GPA is rounded to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

101 John 8.5

102 Alice 9.1

103 Bob 8.5

104 Zoe 7.3

105 Charlie 9.1

Output: 104 Zoe 7.30

103 Bob 8.50

101 John 8.50

102 Alice 9.10

105 Charlie 9.10

### **Answer**

##### 1. Problem Statement

Tony is an e-learning platform administrator, he oversees the user ratings for various online courses offered in the platform.

To enhance user experience, you should assist him in utilizing a HashMap to store course ratings given by learners. Regularly, he analyzes this data to identify the highest and lowest-rated courses, enabling targeted improvements and ensuring the quality of the educational content. This process assists in maintaining a competitive and engaging online learning environment for the users.

##### ***Input Format***

The input consists of a string representing the course name followed by a double value representing the course's rating, in separate lines.

The input is terminated by entering "done".

### **Output Format**

The first line of output prints the string "Highest Rated Course: " followed by the highest-rated course.

The second line prints the string "Lowest Rated Course: " followed by the lowest-rated courses.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: DSA

4.0

OOPS

4.2

C

3.2

done

Output: Highest Rated Course: OOPS

Lowest Rated Course: C

### **Answer**

```
import java.util.HashMap;
import java.util.Map;
import java.util.Scanner;

// You are using Java
class CourseAnalyzer {
    public Map<String, String>
    identifyHighestAndLowestRatedCourses(Map<String, Double> courseRatings){
        Map<String, String> result = new HashMap<>();
        if (courseRatings.isEmpty()) {
            result.put("highest", "");
            result.put("lowest", "");
            return result;
        }
        String highestCourse = null;
```

```

String lowestCourse = null;
double highestRating = Double.MIN_VALUE;
double lowestRating = Double.MAX_VALUE;
for (Map.Entry<String, Double> entry : courseRatings.entrySet()){
    String course = entry.getKey();
    double rating = entry.getValue();
    if (rating > highestRating){
        highestRating = rating;
        highestCourse = course;
    }
    if (rating < lowestRating) {
        lowestRating = rating;
        lowestCourse = course;
    }
}
result.put("highest", highestCourse);
result.put("lowest", lowestCourse);
return result;
}
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        Map<String, Double> courseRatings = new HashMap<>();

        while (true) {
            String courseName = scanner.nextLine();
            if (courseName.equalsIgnoreCase("done")) {
                break;
            }
            double rating = Double.parseDouble(scanner.nextLine().trim());
            courseRatings.put(courseName, rating);
        }

## 2. Problem Statement

Arjun is working on a program that checks if one set of numbers is a subset of another. If Set B is a subset of Set A, the program should print "YES" followed by the sorted elements of Set B. If Set B is not a subset of Set A, the program should print "NO" followed by the average of all elements from both sets combined, rounded to two decimal places.

Implement a class Solution with the required method to perform the subset check using TreeSet in Java.

### **Input Format**

The first line contains an integer n - the number of elements in Set A.

The second line contains n space-separated integers - the elements of Set A.

The third line contains an integer m - the number of elements in Set B.

The fourth line contains m space-separated integers - the elements of Set B.

### **Output Format**

If Set B is a subset of Set A, print "YES" followed by the sorted values of Set B.

Otherwise, print "NO" followed by the average of all numbers in both sets (rounded to two decimal places).

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5  
1 2 3 4 5

3

2 3 5

Output: YES 2 3 5

### **Answer**

```
import java.util.*;

// You are using Java
class Solution {
    public static void checkSubset(TreeSet<Integer> setA, TreeSet<Integer> setB,
int totalCount, long sum) {
        if (setA.containsAll(setB)) {
            System.out.print("YES ");
            for (int x : setB) {
                System.out.print(x + " ");
            }
        } else {
            System.out.print("NO ");
            double avg = (double) sum / totalCount;
            System.out.printf("%.2f", avg);
        }
    }
}

class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        TreeSet<Integer> setA = new TreeSet<>();
        long sum = 0;
        for (int i = 0; i < n; i++) {
            int num = sc.nextInt();
            setA.add(num);
            sum += num;
        }

### 3. Problem Statement

Bob wants to develop a score-tracking application for a gaming tournament. Each player's score is stored in a HashMap with the player's name as the key and the score as the value.

Write a program to assist Bob that takes user input to enter player scores, calculates the maximum score from the HashMap, and prints the player with the highest score.

#### ***Input Format***

The input consists of strings representing player details in the format "playerName:score".

The input is terminated by entering "done".

#### ***Output Format***

The output displays a string, representing the player's name who scored the maximum.

If the value is not numeric, print "Invalid input".

If any special characters other than ':' are given, print "Invalid format".

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: Alice:15  
Bob:56  
done

Output: Bob

**Answer**

```
import java.util.*;

// You are using Java
class ScoreTracker {
    Map<String, Integer> scoreMap = new HashMap<>();
    public boolean processInput(String input){
        if (!input.contains(":") || input.matches(".*^[a-zA-Z0-9:].*")) {
            System.out.println("Invalid format");
            return false;
        }
        String[] parts = input.split(":");
        if (parts.length != 2) {
            System.out.println("Invalid format");
            return false;
        }
        String name = parts[0];
        String scoreStr = parts[1];
        try {
            int score = Integer.parseInt(scoreStr);
            scoreMap.put(name, score);
        }
        catch (NumberFormatException e) {
            System.out.println("Invalid input");
            return false;
        }
        return true;
    }
    public String findTopPlayer() {
        String topPlayer = "";
        int maxScore = Integer.MIN_VALUE;
        for (Map.Entry<String, Integer> entry : scoreMap.entrySet()) {
            if (entry.getValue() > maxScore) {
                maxScore = entry.getValue();
                topPlayer = entry.getKey();
            }
        }
        return topPlayer;
    }
}
```

```

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        ScoreTracker tracker = new ScoreTracker();
        boolean validInput = true;

        while (true) {
            String input = scanner.nextLine();

            if (input.toLowerCase().equals("done")) {
                break;
            }

            if (!tracker.processInput(input)) {
                validInput = false;
                break;
            }
        }

        if (validInput && !tracker.scoreMap.isEmpty()) {
            System.out.println(tracker.findTopPlayer());
        }

        scanner.close();
    }
}

```

**Status :** Correct

**Marks : 10/10**

#### 4. Problem Statement

David is managing an employee database where each employee has a unique ID, name, and department. He wants to ensure that duplicate employee IDs are not added to the system. Implement a Java program that allows adding employees to the system, displaying all employees, and checking if an employee exists based on the given ID.

Implement a class EmployeeDatabase that contains a HashSet to store employee records. The Employee class should be a user-defined object containing employee details. The main class should handle user

operations and interact with the EmployeeDatabase class.

### ***Input Format***

The first line contains an integer  $n$  representing the number of employees to be added.

The next  $n$  lines follow, each containing:

1. An integer `employee_id`
2. A string `name`
3. A string `department`

The next line contains an integer  $m$  representing the number of queries.

The next  $m$  lines follow, each containing an employee ID to check for existence.

### ***Output Format***

The output prints a list of all employees added in the format:

"ID: <employee\_id>, Name: <name>, Department: <department>"

For each query, output "Employee exists" if the ID is found, otherwise "Employee not found".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 3

101 John IT

102 Alice HR

103 Bob Finance

2

101

104

Output: ID: 101, Name: John, Department: IT

ID: 102, Name: Alice, Department: HR

ID: 103, Name: Bob, Department: Finance

Employee exists

Employee not found

**Answer**

```
import java.util.*;

// You are using Java
class Employee {
    int id;
    String name;
    String department;
    Employee(int id, String name, String department) {
        this.id = id;
        this.name = name;
        this.department = department;
    }
    public boolean equals(Object o) {
        if (this == o) return true;
        if (!(o instanceof Employee)) return false;
        Employee e = (Employee) o;
        return this.id == e.id;
    }
    public int hashCode() {
        return id;
    }
}

class EmployeeDatabase {
    private HashSet<Employee> employees = new HashSet<>();
    public void addEmployee(int id, String name, String dept) {
        employees.add(new Employee(id, name, dept));
    }
    public void displayEmployees() {
        for (Employee e : employees) {
            System.out.println("ID: " + e.id + ", Name: " + e.name + ", Department: " +
e.department);
        }
    }
    public boolean checkEmployee(int id) {
        for (Employee e : employees) {
            if (e.id == id)
                return true;
        }
        return false;
    }
}
```

```

    }
}
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        EmployeeDatabase db = new EmployeeDatabase();
        int n = sc.nextInt();
        for (int i = 0; i < n; i++) {
            int id = sc.nextInt();
            String name = sc.next();
            String department = sc.next();
            db.addEmployee(id, name, department);
        }
        db.displayEmployees();
        int m = sc.nextInt();
        for (int i = 0; i < m; i++) {
            int id = sc.nextInt();
            if (db.checkEmployee(id))
                System.out.println("Employee exists");
            else
                System.out.println("Employee not found");
        }
        sc.close();
    }
}

### REC\_2028\_OOPS using Java\_Week 11

Attempt : 1  
Total Mark : 20  
Marks Obtained : 10

#### Section 1 : Project

##### 1. Problem Statement

In Café Central, the menu is cataloged and stored in a database.

To efficiently manage the restaurant's menu using Java and JDBC, you must build a Restaurant Management System that supports:

Adding new menu items

Updating menu item prices

Viewing details of a menu item

Displaying all menu items in sorted order

You are given two files:

File 1: MenuItem.java (POJO Class)

This class represents the MenuItem entity.

A MenuItem contains the following details:

Field	Description
itemId	Unique Menu Item ID (Integer)
name	Item Name (String)
category	Item Category (String)
price	Item Price (Double)

Students must write code in the marked area:

```
class MenuItem {  
    private int itemId;  
    private String name;  
    private String category;  
    private double price;  
  
    public MenuItem() {}  
  
    public MenuItem(int itemId, String name, String category, double price) {  
        // write your code here  
    }  
  
    // Include getters and setters  
}
```

Expected in this part:

Assign parameter values to instance variables inside the constructor.

Add getters and setters for all attributes.

File 2: MenuItemDAO.java (Data Access Layer)

This class handles all database operations using JDBC.

Students must complete the missing JDBC logic in the following methods:

```
class MenuItemDAO {

    public void addItem(Connection conn, MenuItem menuItem)
    throws SQLException {

        // write your code here

    }

    public void updateItemPrice(Connection conn, int itemId, double
    newPrice) throws SQLException {

        // write your code here

    }

    public void deleteMenuItem(Connection conn, int itemId) throws
    SQLException {

        // write your code here

    }

    public MenuItem viewItemDetails(Connection conn, int itemId) throws
    SQLException {

        // write your code here

    }

    public List<MenuItem> displayAllMenuItems(Connection conn) throws
    SQLException {

        // write your code here

    }

    private MenuItem mapToMenuItem(ResultSet rs) throws SQLException {
        return new MenuItem(
```

```
    // write your code here
    );
}
}
```

Expected in this part:

Write SQL queries for INSERT, UPDATE, DELETE, SELECT.

Execute queries using PreparedStatement or Statement.

Map ResultSet rows to MenuItem objects using mapToMenuItem().

Return a List<MenuItem> where required.

The system should connect to a MySQL database using the following default credentials:

DB URL: jdbc:mysql://localhost/ri\_db

USER: test

PWD: test123

The menu table has already been created with the following structure:

Table Name: menu

### ***Input Format***

The first line of input consists of an integer choice, representing the operation to be performed (1 for Add Item, 2 for Restock item, 3 for reduce item, 4 for Display, 5 for Exit).

For choice 1 (Add Menu Item):

- The second line consists of an integer item\_id.
- The third line consists of a string name.
- The fourth line consists of a string category.
- The fifth line consists of a double price.

For choice 2 (Update Item Price):

- The second line consists of an integer item\_id.
- The third line consists of a double new\_price.

For choice 3 (View Item Details):

- The second line consists of an integer item\_id.

For choice 4 (Display All Menu Items):

- No additional inputs are required.

For choice 5 (Exit):

- No additional inputs are required.

### ***Output Format***

For choice 1 (Add Menu Item):

- Print "Menu item added successfully" if the item was added.
- Print "Failed to add item." if the insertion failed.

For choice 2 (Update Item Price):

- Print "Item price updated successfully" if the price update was successful.
- Print "Item not found." if the specified item ID does not exist.

For choice 3 (View Item Details):

- Display the item details in the format:
- ID: [item\_id] | Name: [name] | Category: [category] | Price: [price]
- Print "Item not found." if the specified item ID does not exist.

For choice 4 (Display All Menu Items):

- Display each item on a new line in the format:
- ID | Name | Category | Price
- If no items are available, print nothing (or handle with an appropriate message if desired).

For choice 5 (Exit):

- Print "Exiting Restaurant Management System."

For invalid input:

- Print "Invalid choice. Please try again."

### **Sample Test Case**

Input: 1

11

Margherita Pizza

Main Course

12.99

4

5

Output: Menu item added successfully

ID | Name | Category | Price

11 | Margherita Pizza | Main Course | 12.99

Exiting Restaurant Management System.

## 2. Problem Statement

Create a JDBC-based Hospital Management System that handles runtime input to manage patient records. The system should allow users to:

Add a new patient (patient ID, name, age, status).

Update a patient's status.

View a specific patient's record by patient ID.

Display all patient records in the database.

Exit the application.

The system should connect to a MySQL database using the following default credentials:

DB URL: jdbc:mysql://localhost/ri\_db

USER: test

PWD: test123

The patients table has already been created with the following structure:

Table Name: patients

### ***Input Format***

The first line of input consists of an integer choice, representing the operation to be performed:

(1 for Add Patient, 2 for Update Patient Status, 3 for View Patient Record, 4 for Display All Patients, 5 for Exit)

For choice 1 (Add Patient):

- The second line consists of an integer patient\_id.
- The third line consists of a string name.
- The fourth line consists of an integer age.
- The fifth line consists of a string status.

For choice 2 (Update Patient Status):

- The second line consists of an integer patient\_id.
- The third line consists of a string new\_status.

For choice 3 (View Patient Record):

- The second line consists of an integer patient\_id.

For choice 4 (Display All Patients):

- No additional inputs are required.

For choice 5 (Exit):

- No additional inputs are required.

### ***Output Format***

For choice 1 (Add Patient):

- Print "Patient added successfully" if the patient was added.

- Print "Failed to add patient." if the insertion failed.

For choice 2 (Update Patient Status):

- Print "Patient status updated successfully" if the update was successful.
- Print "Patient not found." if the specified patient ID does not exist.

For choice 3 (View Patient Record):

- Display the patient details in the format:
- ID: [patient\_id] | Name: [name] | Age: [age] | Status: [status]
- Print "Patient not found." if the specified patient ID does not exist.

For choice 4 (Display All Patients):

- Display each patient on a new line in the format:
- ID | Name | Age | Status
- If no records are available, print nothing (or handle it with an appropriate message if desired).

For choice 5 (Exit):

- Print "Exiting Hospital Management System."

For invalid input:

- Print "Invalid choice. Please try again."

### **Sample Test Case**

Input: 1

101

John Doe

45

Admitted

4

5

Output: Patient added successfully

ID | Name | Age | Status

101 | John Doe | 45 | Admitted

Exiting Hospital Management System.

**Answer**

```

### REC\_Week 12\_Java\_Lamba Expressions\_MCQ

Attempt : 1  
Total Mark : 10  
Marks Obtained : 9

#### Section 1 : MCQ

1. What is the syntax for a basic lambda expression in Java?

**Answer**

(parameters) -> expression

**Status : Correct**

**Marks : 1/1**

2. Which functional interface is commonly used with lambda expressions in Java?

**Answer**

Runnable

**Status : Correct**

**Marks : 1/1**

3. What is the return type of a lambda expression in Java?

**Answer**

The return type is inferred from the context

**Status : Correct**

**Marks : 1/1**

4. Can a lambda expression in Java have a body with multiple statements?

**Answer**

Yes, if the statements are enclosed in curly braces

**Status : Correct**

**Marks : 1/1**

5. Which of the following is a valid lambda expression in Java?

**Answer**

(x) -> x \* 2

**Status : Wrong**

**Marks : 0/1**

6. What is a lambda expression in Java?

**Answer**

A way to define anonymous methods

**Status : Correct**

**Marks : 1/1**

7. Which functional interface in Java takes two arguments and returns a result?

**Answer**

BiFunction

**Status : Correct**

**Marks : 1/1**

8. Can a lambda expression have more than one parameter?

**Answer**

Yes, it can have multiple parameters

**Status : Correct**

**Marks : 1/1**

9. Which of the following interfaces is NOT a functional interface in Java?

**Answer**

Iterable

**Status : Correct**

**Marks : 1/1**

10. Can a lambda expression in Java have a body with multiple statements?

**Answer**

Yes, if the statements are enclosed in curly braces

**Status : Correct**

**Marks : 1/1**

##### 1. Problem Statement

Sabrina is working on a project that involves analyzing a set of numbers. In her exploration, she encounters scenarios where extracting even numbers and finding their sum is essential.

Create a program that calculates the sum of even numbers from a given array of integers using a lambda expression.

##### ***Input Format***

The first line of input consists of an integer N, representing the size of the array.

The second line consists of N space-separated integers, representing the elements of the array.

##### ***Output Format***

The output prints the sum of the even integers from the array.

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: 3

29 37 45

Output: 0

**Answer**

```
import java.util.*;
import java.util.stream.*;
public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int[] arr = new int[N];
        for (int i = 0; i < N; i++) {
            arr[i] = scanner.nextInt();
        }
        int sumEven = Arrays.stream(arr)
            .filter(x -> x % 2 == 0)
            .sum();
        System.out.println(sumEven);
    }
}
```

##### 1. Problem Statement

Alex is learning about Java's functional interfaces and lambda expressions.

He wants to write a simple program that prints the square of each number in an array using a predefined functional interface.

Help Alex complete this task using the Consumer functional interface.

##### ***Input Format***

- The first line contains an integer N, the number of elements in the array.
- The second line contains N space-separated integers.

##### ***Output Format***

- Print the squares of all elements in the array, separated by a space.

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: 4

1 2 3 4

Output: 1 4 9 16

**Answer**

```
import java.util.*;
import java.util.function.Consumer;
public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int[] arr = new int[N];
        for (int i = 0; i < N; i++) {
            arr[i] = scanner.nextInt();
        }
        Consumer<Integer> printSquare = x -> System.out.print(x * x + " ");
        for (int num : arr) {
            printSquare.accept(num);
        }
        System.out.println();
    }
}
```

##### 1. Problem Statement

In the mystical realm of programming, there exists a magical incantation to reveal hidden words.

Elara, the skilled enchantress, wishes to summon a word using her spell and then reverse its characters to uncover its enchanted reflection.

Write a program that uses the predefined functional interface `Supplier<String>` and a lambda expression to:

Supply (generate) a string, and

Display its reversed form.

**Input Format**

No input is required from the user.

The string must be supplied internally using a Supplier<String>.

**Output Format**

Print the reversed version of the supplied string.

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: Wizard!!

Output: !!draziW

**Answer**

```
import java.util.*;
import java.util.function.Supplier;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String input = sc.nextLine();
        Supplier<String> supplier = () -> input;
        String str = supplier.get();
        String reversed = new StringBuilder(str).reverse().toString();
        System.out.println(reversed);
    }
}
```

##### 1. Problem Statement

Abi is working on a text analysis project where she needs to categorize words based on their length.

Words that have three or fewer characters are considered "Short", while words with more than three characters are classified as "Long."

Write a Java program that takes a sentence as input, analyzes each word, and prints a list showing whether each word is "Short" or "Long."

Use the predefined functional interface `Function<String, String>` along with a lambda expression for categorization.

**Input Format**

A single line containing a sentence (words separated by spaces).

### **Output Format**

- A single line with each word categorized as "Short" or "Long", separated by spaces.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: I love my cat

Output: Short Long Short Short

### **Answer**

```
import java.util.*;
import java.util.function.Function;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine().trim();
        String[] words = sentence.split("\\s+");
        Function<String, String> categorize = word ->
            word.length() <= 3 ? "Short" : "Long";
        for (String word : words) {
            System.out.print(categorize.apply(word) + " ");
        }
    }
}

##### 1. Problem Statement

Rishi is working as an HR analyst in a software company. He wants to filter a list of employees based on their salary using modern Java techniques. He has a list of employee names and salaries and wants to use lambda expressions to filter those who earn more than a specific threshold.

Implement a program using lambda expressions and functional interfaces to print the names of employees whose salary is greater than or equal to 50,000.

##### ***Input Format***

The first line of input consists of an integer n, representing the number of employees.

The next n lines. Each line contains a String (employee name) and an int (salary).

### **Output Format**

The output prints the names of employees whose salary is greater than or equal to 50000, each on a new line.

If no employee found with salary greater than 50000, print: No employee found with salary  $\geq$  50000

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 4  
Amit 45000  
Sneha 50000  
Ravi 60000  
Priya 30000  
Output: Sneha  
Ravi

### **Answer**

```
import java.util.*;
import java.util.function.Predicate;
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine().trim());
        List<String> employees = new ArrayList<>();
        List<Integer> salaries = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            String line = sc.nextLine().trim();
            String[] parts = line.split("\\s+");
            employees.add(parts[0]);
            salaries.add(Integer.parseInt(parts[1]));
        }
        Predicate<Integer> isHighSalary = sal -> sal >= 50000;
        boolean found = false;
        for (int i = 0; i < n; i++) {
            if (isHighSalary.test(salaries.get(i))) {
```

```

        System.out.println(employees.get(i));
        found = true;
    }
}
if (!found){
    System.out.println("No employee found with salary >= 50000");
}
}
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Emily, an analyst at a data processing firm, is tasked with cleaning up datasets to remove duplicate values from lists of integers.

Create a Java program that allows Emily to input a series of integers, with the program then utilizing a lambda expression to efficiently remove any duplicates.

### **Input Format**

The first line of input consists of an integer N, representing the size of the array.

The second line consists of N space-separated integers, each denoting an array element.

### **Output Format**

The output prints the array elements after removing the duplicates inside the square bracket separated by a comma and space.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 15

1 2 3 4 3 2 1 2 3 4 4 4 5 5 6

Output: [1, 2, 3, 4, 5, 6]

**Answer**

```
import java.util.*;
import java.util.function.Function;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int N = Integer.parseInt(sc.nextLine().trim());
        String[] arr = sc.nextLine().trim().split("\\s+");
        Function<String[], List<Integer>> removeDuplicates = (inputArray) -> {
            Set<Integer> seen = new LinkedHashSet<>(); // preserves order
            for (String s : inputArray) {
                seen.add(Integer.parseInt(s));
            }
            return new ArrayList<>(seen);
        };
        List<Integer> result = removeDuplicates.apply(arr);
        System.out.println(result);
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Sneha is developing a feature for an e-commerce application that helps display product details after applying a seasonal discount.

She decides to use lambda expressions with the Consumer functional interface to print each product's name, original price, and discounted price neatly.

The program should:

Accept a list of product names and their prices. Apply a 15% discount on all products. Use a Consumer lambda expression to display the details in a formatted manner.

**Input Format**

The first line of input consists of an integer n, representing the number of products.

The next n lines each contain a String (product name) and a double (price) separated by a space.

### **Output Format**

For each product, print the details in the format:

Product: <name>, Original Price: <price>, Discounted Price: <discounted price>

If there are no products, print:

No products available

### **Sample Test Case**

Input: 1

Phone 60000

Output: Product: Phone, Original Price: 60000.0, Discounted Price: 51000.0

### **Answer**

```
import java.util.*;
import java.util.function.Consumer;
class Product {
    String name;
    double price;
    Product(String name, double price) {
        this.name = name;
        this.price = price;
    }
}
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine().trim());
        if (n == 0) {
            System.out.println("No products available");
            return;
        }
        List<Product> products = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            String line = sc.nextLine().trim();
```

```

String[] parts = line.split("");
String name = parts[0];
double price = Double.parseDouble(parts[1]);
products.add(new Product(name, price));
}
Consumer<Product> printDetails = p -> {
    double discounted = p.price - (p.price * 0.15);
    System.out.println(
        "Product: " + p.name +
        ", Original Price: " + p.price +
        ", Discounted Price: " + discounted
    );
};
for (Product p : products) {
    printDetails.accept(p);
}
sc.close();
}
}

```

**Status :** Partially correct

**Marks :** 7.5/10

#### 4. Problem Statement

Aditya is developing a reading app that recommends books to users based on a predefined list.

Each time a user opens the app, it should supply the next book title in the list, one at a time, using a lambda expression and the Supplier functional interface.

When all books have been recommended, the list should start again from the beginning.

##### **Input Format**

The first line contains an integer  $n$  — the total number of available book titles.

The next  $n$  lines each contain a book title (a string).

The next line contains an integer  $m$  — the number of times users open the app

(i.e., the number of recommendations to be made).

### **Output Format**

Print the supplied book title for each recommendation, one per line.

If  $m > n$ , repeat the list from the start.

### **Sample Test Case**

Input: 3

The Alchemist

Atomic Habits

Ikigai

5

Output: The Alchemist

Atomic Habits

Ikigai

The Alchemist

Atomic Habits

### **Answer**

```
import java.util.*;
import java.util.function.Supplier;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine().trim());
        List<String> books = new ArrayList<>();
        for (int i = 0; i < n; i++){
            books.add(sc.nextLine());
        }
        int m = Integer.parseInt(sc.nextLine().trim());
        final int[] index = {0};
        Supplier<String> bookSupplier = () -> {
            String title = books.get(index[0]);
            index[0] = (index[0] + 1) % n;
            return title;
        };
        for (int i = 0; i < m; i++) {
            System.out.println(bookSupplier.get());
        }
    }
}
```

##### 1. Problem Statement

Riya is developing a college admission system that assigns unique roll numbers to each newly admitted student.

Each roll number should follow this fixed format:

<DEPT>-<YEAR>-<4-digit-sequence>

where:

<DEPT> is the department code (in uppercase, e.g., CSE, ECE, MECH). <YEAR> is the admission year (e.g., 2025). <4-digit-sequence> starts from a given number and increases sequentially for each student. Write a Java program using a Supplier<String> lambda to generate and print the roll numbers for n students.

**Input Format**

First line: integer n — number of roll numbers to generate

Second line: string DEPT — department code (uppercase letters only)

Third line: integer YEAR — admission year

Fourth line: integer start — starting sequence number ( $0 \leq \text{start} \leq 9999$ )

### **Output Format**

Print n roll numbers, one per line, in the required format

Sequence must be zero-padded to 4 digits

If sequence exceeds 9999, wrap around to 0000

### **Sample Test Case**

Input: 5

CSE

2025

98

Output: CSE-2025-0098

CSE-2025-0099

CSE-2025-0100

CSE-2025-0101

CSE-2025-0102

### **Answer**

```
import java.util.Scanner;
import java.util.function.Supplier;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        String dept = sc.nextLine().trim();
        int year = Integer.parseInt(sc.nextLine());
        int start = Integer.parseInt(sc.nextLine());
        final int[] seq = { start };
        Supplier<String> rollSupplier = () -> {
            String roll = String.format("%s-%d-%04d", dept, year, seq[0]);
            seq[0] = (seq[0] + 1) % 10000; // wrap around after 9999
            return roll;
        };
    }
}
```

```
        for (int i = 0; i < n; i++) {  
            System.out.println(rollSupplier.get());  
        }  
    }  
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

A company named TechNova is collecting feedback from its customers. Each customer gives a feedback score (an integer between 1 and 10) along with their name.

The company wants to:

Display each customer's name along with their feedback in a formatted way using a lambda expression and a Consumer functional interface. After displaying all feedbacks, calculate and display the average feedback score. You need to implement this functionality using Java lambda expressions and streams, emphasizing the Consumer interface for displaying formatted output.

### ***Input Format***

The first line of input contains an integer  $n$ , representing the number of customers.

The next  $n$  lines each contain a String (customer name) followed by an int (feedback score).

### ***Output Format***

- Each line prints a customer's name and feedback in the format:
- Customer: <name>, Feedback Score: <score>

- After all customers are displayed, print the average feedback as:
- Average Feedback: <average\_value>

(Average should be displayed up to two decimal places.)

### **Sample Test Case**

Input: 3

Ravi 7

Ananya 9

Kiran 8

Output: Customer: Ravi, Feedback Score: 7

Customer: Ananya, Feedback Score: 9

Customer: Kiran, Feedback Score: 8

Average Feedback: 8.00

### **Answer**

```
import java.util.*;
import java.util.function.Consumer;
import java.util.stream.Collectors;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        List<Customer> customers = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            String name = sc.next();
            int score = sc.nextInt();
            customers.add(new Customer(name, score));
        }
        Consumer<Customer> displayFeedback = c ->
            System.out.println("Customer: " + c.name + ", Feedback Score: " +
c.score);
        customers.forEach(displayFeedback);
        double avg = customers.stream()
            .collect(Collectors.averagingInt(c -> c.score));
        System.out.printf("Average Feedback: %.2f", avg);
    }
}
class Customer {
    String name;
    int score;
    Customer(String name, int score) {
```

```
this.name = name;  
this.score = score;  
}  
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

#### Problem Statement

Sophia, a data analyst, is studying experimental results collected from various lab sensors. Each sensor provides a list of numeric readings, and Sophia wants to calculate the average of these readings to analyze consistency.

She decides to use lambda expressions and the Function functional interface to compute the average of all the recorded values efficiently.

#### Your Task

Write a Java program that:

Reads the total number of measurements. Reads all the measurement values as doubles. Uses a `Function<double[], Double>` lambda expression to calculate the average value. Displays the final average, formatted to two decimal places.

#### Input Format

The first line of input consists of an integer `N`, representing the number of measurements.

The second line contains `N` space-separated double values.

#### Output Format

Print the average of the entered values, rounded to two decimal places.

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 6

2.2 1.2 5.4 4.6 2.9 55.7

Output: 12.00

### Answer

```
import java.util.*;
import java.util.function.Function;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());
        double[] arr = new double[n];
        for (int i = 0; i < n; i++) {
            arr[i] = sc.nextDouble();
        }
        Function<double[], Double> averageFunction = values -> {
            double sum = 0;
            for (double v : values) {
                sum += v;
            }
            return sum / values.length;
        };
        double average = averageFunction.apply(arr);
        System.out.printf("%.2f", average);
    }
}
```

Status : Correct

Marks : 10/10

## 4. Problem Statement

Nethra is a researcher working on a project that involves analyzing experimental data. As part of her analysis, she needs to determine whether a given word is a palindrome or not.

Create a Java program that allows Nethra to input a word, and then check and display whether the entered word is a palindrome. Use lambda expressions to perform the palindrome check.

### ***Input Format***

The first line of input consists of a word.

### ***Output Format***

The output prints whether the given word is a palindrome or not in the following format:

"<input> is palindrome" or "<input> is not palindrome".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: malayalam

Output: malayalam is palindrome

### ***Answer***

```
import java.util.*;
import java.util.function.Function;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String word = sc.nextLine().trim();
        Function<String, Boolean> isPalindrome = s ->
            s.equals(new StringBuilder(s).reverse().toString());
        if (isPalindrome.apply(word)) {
            System.out.println(word + " is palindrome");
        }
        else{
            System.out.println(word + " is not palindrome");
        }
    }
}
```
